THE Premier Word Processing Package – CREATIVE COMPUTING

NEW!
• PAPERCLIP II for COMMODORE 128
• PAPERCLIP for APPLE II/E/C
• SPELLPACK for ATARI 130XE
Coming Soon
PAPERCLIP ELITE

"PaperClip is easy to use, yet offers the advanced features of programs designed for the IBM PC. These include: block move, copy, delete, macros, automatic page numbering, headers, footers, underlining, boldface, super and subscripts, variable character pitch, and custom character sets. The editing screen can be set up to 130 columns wide, & text can be scrolled in any direction. A preview mode displays formatted text exactly as it will appear on the printed page. You may further define your own formatting parameters, including margins, line lengths, page length and spacing.
PaperClip contains over 30 printer files for all the current major models. The documentation is excellent and the disk itself unprotected, though keyed through a joystick port. This means you can make as many back-up copies as you like, but can use the program only when the key is inserted." - CREATIVE COMPUTING

Antic—The Atari Resource is published twelve times per year by Antic Publishing. Editorial offices are located at 524 Second Street, San Francisco, CA 94107. ISSN 0745-2527. Second Class Postage paid at San Francisco, California and additional mailing offices. POSTMASTER: Send address change to **Antic**, P.O. Box 1919, Marion, OH 43306.

Subsciptions: One year (12 issues) $28. Canada and Mexico add $8, other foreign add $12. Action Edition (12 issues with disks) $99.95, all foreign add $25.

Editorial submissions should include text and program listings on disk and paper. Submissions will be returned if stamped, self-addressed mailer is supplied. **Antic** assumes no responsibility for unsolicited editorial material.

COMP COMPLAINT

I was trying to use the variable COMP in a gambling program I'm writing. When I enter this line and press [RETURN], I get an error message. I then tried to use COMP as a command. I typed COMP (42) and I didn't get an error message. The computer just printed out READY. What is this command for?

Brian Korn
Del Mar, CA

The COM statement performs the same function as the DIM statement. It was left out of the original Atari BASIC due to lack of space. COM was supposed to allow two programs to share variables in COMmon, a la FORTRAN. Although this was dropped, for some reason the COM keyword was left in and redirected to DIM.

Use LET to get around the problem like this:

```
10 LET PRINT=10
20 LET RUN=20
30 LET GOSUB=5
40 LET RETURN=12
50 PRINT GOSUB*RUN+(PRINT/
RETURN)
```

ACE ACKNOWLEDGES

Many thanks for recognizing our users group with an Antic Award (May 1986). As always, group accomplishments represent the efforts of more than one individual. In our case, credit is due to Mike Dunn, founder of Eugene ACE and one of the very first owners, anywhere, of an Atari computer. Also to Larry Gold, the club's unofficial general manager and all around sparkplug, and our Official ST Enthusiast, Jim Bumpas. Without these three, I doubt that ACE would exist at all, let alone thrive. As an **Antic** subscriber, I would like to acknowledge your own special contributions to all Atari users. Thank you for recognizing the work of all groups listed in your May awards issue.

Richard Barkley
President,
Atari Computer
Enthusiasts
Eugene, OR

FUJI IN PRINT

How can I print the Atari Fuji symbol shown in the upper right corner of the optional character box in the 1st-Word ST word processor? I am using my ST with the Star SG-10 printer in IBM mode.

Brad Fallon
Moscow, Idaho

1st-Word normally treats ASCII text files as just that—ASCII characters. Printers are designed to expect ASCII values and print them as characters. The two character strings which make up the left and right halves of the 1st-Word Atari Fuji are CHR$(14)+CHR$(15). These are not ASCII characters and so they are not recognized by most printers. The Fuji is printable as a screen dump on any pin-addressable printer, such as your Star SG-10. To do this, hold down the [ALTERNATE] key while pressing [HELP].
—ANTIC ED

I/O MAKES THE GRADE

Because of budget constraints, all we have in my second grade classroom is one Atari 800 and an old TV. It didn't take long for the kids to exhaust the supply of programs in my two books, so **Antic** came to the rescue. I am a compulsive filer, and had clipped and filed all the articles in my back issues. I gathered all the short graphics programs I could find (usually from I/O board) and took them into school. The kids are still pleading with me to stay in at recess an go back to the computer and "play." So, **Antic** readers, keep those little programs coming in!

Rebecca Pyle
Mechanicsburg
Schools
Urbana, OH

***Antic** will gladly print interesting mini listings in the I/O Board or as Tech Tips. We have an open invitation for readers to send in their best short programs.*—ANTIC ED

TOUGH FIGHT

In the first lesson of the New Owners Column (**Antic**, March 1986) the author

continued on page 8

Finally, a mouse for your Atari 400, 800, XL or XE!

It's like getting a new computer!

Sure your Atari has super resolution. But no mouse. The March issue of *Analog* said that a mouse would make the 8-bit Atari "the toughest competitor on the 8-bit market" . . . that it would be great if these computers had a mouse. Now they do! Because we just developed the RAT. It's not merely a mouse, but an entire graphics system capable of generating high resolution drawings, graphs, charts and decorations.

And right now you save $55 to $85 over mice made for other 8-bit computers.

Already such software as *Super 3-D Plotter*®, *Master Disk DirectoryII*®, *Writer80*®, *Rambrandt*® and *AtariArtist*® have RAT-compatible versions.

Other software companies are scrambling to make their products RAT-compatible. They love the RAT. They should, the thousands of Atari 400, 800, XL and XE owners represent a huge new customer base for their mouse-only programs. Look for the RAT-compatible seal on the package.

enhanced!
Look for this logo for official RAT-enhanced software!

We also developed the RAT PACK Starter System to accompany the RAT.

It's a package of software that will let us do a variety of exciting graphics. Draw. Make diagrams. Use for creative sketching.

The time for bland reports has ended. Develop them with professional excitement . . . even technical drawings . . . with the RAT and the RAT PACK. Included in the PACK are: **RAT TRACE**, an icon-driven ACCU-DRAW program for high resolution drawings and graphics developed by Vision Software. It's part of the RAT PACK Starter System. Also included is **RAT CONTROL**, a simple program that lets you move the cursor by pushing the mouse—in any direction, at any time, quickly.

You also receive instructions on how to use the RAT in your own programs, without the use of any machine language or complicated routines.

NEW PRICE $69.95

Get a virtual new computer! Send for RAT and RAT PACK Today!

Does "mouseless" mean "lifeless?" Wake up your Atari into a virtual new computer. Do graphs, diagrams, send sketches—with professional high resolution and excitement.

Send check or money order! Only ~~$114.95~~
Or call for C.O.D.!

said, "I won't assume you know anything about your computer except how to hook it up." That described me perfectly. But there was no mention of how to format a disk. An unformatted disk now means to me seeing BOOT ERROR down the length of the screen.

A quick call to my more knowledgeable friend quickly put that matter to rest. He even told me how to bring up the commands for DOS 2.5. But my disk drive came with DOS 3. Another call to him resulted in—not much. It appears he has changed his phone to an unlisted number in lower-left Beirut where it is much quieter. I then followed your suggestion about obtaining a copy of Lon Poole's *Your Atari Computer*, rushed home to read it and found only an explanation of DOS 1 and 2—nothing about DOS 3.0 or 2.5. Is this a plot or what?

I finally got that program running, but it was a tough fight. Now, what is this that I hear about my 800XL having BASIC B, but a C version is better? Did my wife put you up to it? She said I was spending too much time with my computer when I could be watching "Remington Steele" on TV with her.

Thomas Wood
Indianapolis, IN

You can get DOS 2.5 and BASIC Revision C from Atari Corp., Customer Relations Dept., 1196 Borregas Avenue, Sunnyvale, CA 94086. The Rev. C BASIC cartridge costs $15 plus $2.50 for mailing. Send Atari your DOS 3 disk for a free exchange with DOS 2.5—which is compatible with DOS 2. Any 1986 ***Antic*** *monthly disk contains DOS 2 in the DOS.SYS, DUP.SYS files, or you can obtain these files from a local Atari users group.*—ANTIC ED

1040ST RAMDISK

When ***Antic*** *installed a RAMdisk on our in-house 1040ST, it started out correctly as drive D. But when we re-booted after a program crash, the RAMdisk called itself drive E and couldn't be accessed. We quickly booted again several more times and each time the drive letter advanced by one—drive F, drive G, etc. We let the 1040ST sit for a few minutes while we pondered the problem. When we booted*

continued from page 8

once again, the RAMdisk was back at drive D.

After a telephone call to Atari, we found that the hefty power supply built into the 1040ST has a lot of energy in reserve. After the 1040ST is turned off, 10-15 seconds may pass before the power drops down to a level allowing the RAM to forget which drive the RAMdisk wanted to use. Like an elephant, the 1040ST tries hard to remember, so just let the computer sit for a few extra seconds between boot-ups if you're using a RAMdisk.

PUBLISHING MACHINE

The immediate future of computers lies in desktop publishing, and I can't think of a better computer for this than the Atari 8-bit. However, I and countless others may be forced into buying an Apple (yechh!) for this purpose, simply because there is so little Atari publishing software available. I would love to buy Newsroom for the Atari, but Springboard only seems to be releasing it for Apple. Even Broderbund's Print Shop has a new disk of fonts that is currently only available for the Apple and Commodore. Xlent has created Typesetter and Rubber Stamp for the Atari, but the documentation is confusing. I bought both packages and still don't know how to use them.

How much better to be known as the "desktop publishing computer" than the "game machine." Perhaps Atari owners and software companies can join together to overcome this obstacle.

Lee Ellis
Indio, CA

We edit ***Antic*** *entirely on 8-bit Ataris with PaperClip, then transmit the copy via modem to our typesetter. Our art department pastes up the copy manually and sends it to the printer. Of course, that's not "desktop" publishing—the art of doing the typesetting, layout and printing in-house with a personal computer and laser printer. For the ST, desktop publishing programs such as PCA's Graphic Artist are in the works, and Atari Corp. is working on an ST laser printer.*

STABLE SHAPES

I applied this pattern:

```
 xx
x  x
 xx
```

which I remember being told in my chemistry class is a very stable pattern for carbon, to *Life Revisited,* (**Antic**, April 1986). Indeed, the shape remained constant from the very beginning.

Martin Levi
Kew Gardens, NY

Antic *welcomes your feedback, but we regret that the large volume of mail and online messages makes it impossible for the Editors to reply to everyone. Although we do respond to as much reader correspondence as time permits, our highest priority must be to publish (and upload) I/O answers to questions that are meaningful to a substantial number of readers and online subscribers.*

Send letters to: Antic I/O Board, 524 Second Street, San Francisco, CA 94107. *ANTIC ONLINE has an I/O section for email to the Editors only—online queries about Antic products should be uploaded to the Customer Service I/O section of ANTIC ONLINE.*

WEATHER MAPS FROM SPACE

BY CHARLES JACKSON, ANTIC TECHNICAL EDITOR

Tune in a weather satellite and downlink a few pictures from space! A standard shortwave radio plus this issue's WEFAX Decoder software and WEFAX Interface board are all that your Atari needs for receiving and displaying Weather Facsimile pictures from the satellites of the U.S. and other nations, as well as facsimile photos from newswire services.

This Weather Facsimile system is the most ambitious project ever published by **Antic**. It required more than six months of intensive research, programming and hardware development. But the result is the most versatile and friendliest weather satellite software available for the Atari 8-bit and ST computers.

The reason this project turned out to be so demanding is that its success depends on many factors—including software, hardware and the forces of nature. Especially important are what type of radio and antenna you use, and the area you live in.

You need a shortwave radio capable of receiving SSB (single sideband) signals. Inexpensive "all-band" portables with telescoping antennas will not suit our purposes. We developed these programs using a Radio Shack DX-302 attached to a 25-foot longwire antenna. But for good results, you should use the best receiver and outdoor shortwave antenna you can

continued on next page

Antic technical staffers (from left) Bill Marquardt, Charles Jackson and Patrick Bass discuss methods of adapting the 8-bit WEFAX program to the 520 ST.

afford.

Also, even if you type in the program perfectly and build the interface circuit without a hitch, you could be out of luck if you live in an area with poor shortwave reception. WEFAX signals are clearest in suburban and rural areas. If you live in the center of a large city, you may have trouble receiving a clean WEFAX picture.

PROJECT ELEMENTS

Before you can use the Decoder programs, you'll have to build the WEFAX Interface described in this issue. The interface is a simple circuit that can be built for under $20.

Listing 1, WEFAX.BAS, is a BASIC program which creates the WEFAX.EXE machine language program for Atari 8-bit computers. Antic Disk subscribers will find a copy of WEFAX.EXE on the monthly disk. Copy WEFAX.EXE to another disk and rename it AUTORUN.SYS, then follow the instructions in the accompanying articles.

Listings 2 and 3, FAX.M65 and FAXA.M65, contain the MAC/65 source code for WEFAX.EXE. You do *not* need to type in these listings to use the WEFAX program.

Listing 4, WESIM.BAS, is a BASIC program that simulates a WEFAX signal. If you've never heard a WEFAX signal, this program will create one for you. Listing 5, WETST.BAS, is a BASIC program that helps you test your WEFAX Interface circuit.

The ST version of WEFAX Decoder is WEFAX.TOS and you'll find the article explaining it in this issue's ST Resource section.

THANK YOU!

Finally, **Antic** would like to thank all the people who helped us with this project, including: Dr. Ralph Taggart, Dr. Marty Goodman, CompuServe Vice-President Sandy Trevor, Gary Sargent (creator of the first WEFAX program for the Atari), Michael Schuster, Vic Moore, Jim Grubs, Chris Elmquist and Wayne Day. Special thanks to the staff of the San Francisco Area Office of the National Oceanic and Atmospheric Administration.

SUGGESTED READING

If you want to learn more about Weather Satellite transmissions, here are some of the best sources to get you started:

The New Weather Satellite Handbook, by Dr. Ralph Taggart. This is the definitive text on WEFAX. Formerly out of print, an updated edition of this popular book is available from the author for $12.50. Add $2 for orders outside the U.S. Write: Dr. Ralph Taggart, 602 S. Jefferson, Mason, MI, 48854.

Hidden Signals, Second Edition, by Thomas Harrington and Bob Cooper Jr. Although its discussion of weather satellites is rather brief, this book is packed with information about satellite television, AP-UPI satellite relays, stereo downlinks, teletext and videotext services. If you want to learn more about communications satellites, this book belongs on your shelf. $19.95, Universal Electronics, Inc., 4555 Groves Road, Suite 13, Columbus, OH, 43232. (614) 866-4605.

The Shortwave Facsimile Frequency Guide, $14.95. Universal Electronics Inc., 4555 Groves Road, Suite 13, Columbus, OH 43232.

Weather Fax Guide. Informative free catalog from Atlantic Surplus Sales, 3730 Nautilus Avenue, Brooklyn, NY, 11224. (718) 372-0349.

Weather Satellite Fact Sheet. Free leaflet from Radio Nederlands, P.O. Box 222, Hilversum, The Netherlands.

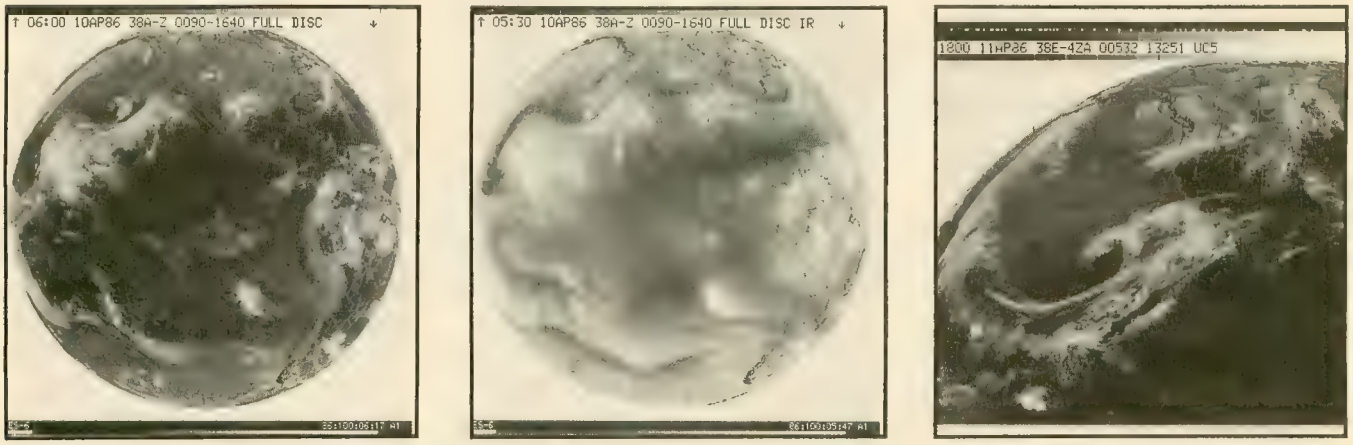
Operating a Weather Satellite Ground Station. Free from NASA Educational Programs Office, Code 202, Goddard Space Flight Center, Greenbelt, MD 20771.

If you're a CompuServe subscriber, you can also find WEFAX information in the HAM radio SIG (type GO HAMNET) and in the Radio Shack Color Computer SIG (type GO COCO).

WEATHER FACSIMILE WORLDWIDE

From satellites to ships at sea

by CHARLES JACKSON, **Antic** Technical Editor



Satellite photos of Earth from GOES-6. The left and right images were made with standard optical cameras, and the center picture comes from an infrared camera. Infrared (IR) cameras detect heat, rather than light, and can be used at night when there is not enough light for optical cameras to function. In an IR photograph, cold objects are white and warmer objects are displayed in darker colors.

WEFAX (pronounced WEE-fax) is short for Weather Facsimile and refers to a method of transmitting photographs and weather satellite maps via radio and telephone lines. WEFAX is a joint project of the National Oceanic and Atmospheric Administration (NOAA) and the National Environmental Satellite, Data and Information Service (NESDIS).

One important use of WEFAX is to receive facsimile weather maps from satellites, add additional information such as drawing a map of the globe over them, and relay them to ships at sea. Shipping and fishing industries throughout the world rely on satellite weather data every day.

Meteorologists use weather satellite data to measure ozone, water vapor and pollution levels; to plot storms, jet streams and fronts; and to monitor fog, snow and ice cover. Weather satellite photos have also been used to monitor river levels and to detect forest fires. For example, the National Weather Service in Redwood City, California, used photographs from the GOES-6 satellite to help emergency workers locate many of the larger wildfires at Big Sur, California, on June 11, 1985.

WEFAX data is collected and transmitted 24 hours a day by more than 1,000 manned and unmanned weather stations. The first weather satellite, TIROS I, (Television and Infrared Observation Satellite) was launched April 1, 1960, and placed into an orbit 600 miles above the earth. Meteorologists used the TIROS photographs to monitor cloud cover and forecast the weather.

By 1966, NASA had launched ten TIROS satellites, which began photographing the entire earth daily, a project which continues to this day.

Most modern weather satellites are equipped with sensitive cameras which cover several wavelengths in the visible light and infrared (IR) spectrum. These cameras can detect objects as small as 1,000 yards across.

THE WEFAX CYCLE

Approximately one-third of the WEFAX pictures intended for the United States come from one of the polar orbiting NOAA satellites. The remainder come from a Geostationary Operational Environmental Satellite (GOES).

A satellite picture usually makes several stops on its way from earth orbit to a ship at sea. Basically, the satellite broadcasts an image to a "master" ground station. This station cleans up the image and relays it to satellite field service stations throughout the country. These "secondary" stations relay the images and weather maps to ships at sea, or to your Atari.

Let's follow a satellite image from earth orbit to your Atari.

continued on next page

1. The satellites form a high-resolution full-disk image of the earth. These images are usually optical photographs (*Figure 1*), or infrared photographs (*Figure 2*).

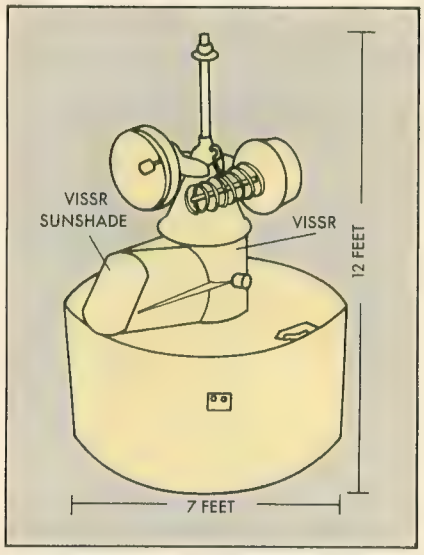
2. The satellite transmits the image to a ground station in Wallops Island, Virginia. The image is transmitted on an S-band (microwave) frequency, usually 1691.0 mHz. Satellite pictures are normally transmitted every 30 minutes.

The Wallops Island facility is known as a Command and Data Acquisition station, or CDA. A CDA can receive data from a satellite and transmit instructions to control and position it.

The CDA transmits this data (via telephone lines) to the Central Data Distribution Facilities (CDDF) in the World Weather Building located in Suitland, Maryland.

3. At the CDDF, an image processing computer magnifies the full-disk picture, enhances it, draws a map over it, divides it into four quarter-disk pictures *(Figure 3)* and sends it back to the CDA at Wallops Island. The CDA transmits the processed ("massaged") satellite picture back to a GOES satellite on a similar S-band frequency of 2032 mHz.

4. The GOES satellite, now acting like a communications satellite, relays the picture to several Satellite Field Service Stations, such as WSFO in Redwood City which broadcasts over the NMC transmitter at nearby Point Reyes.

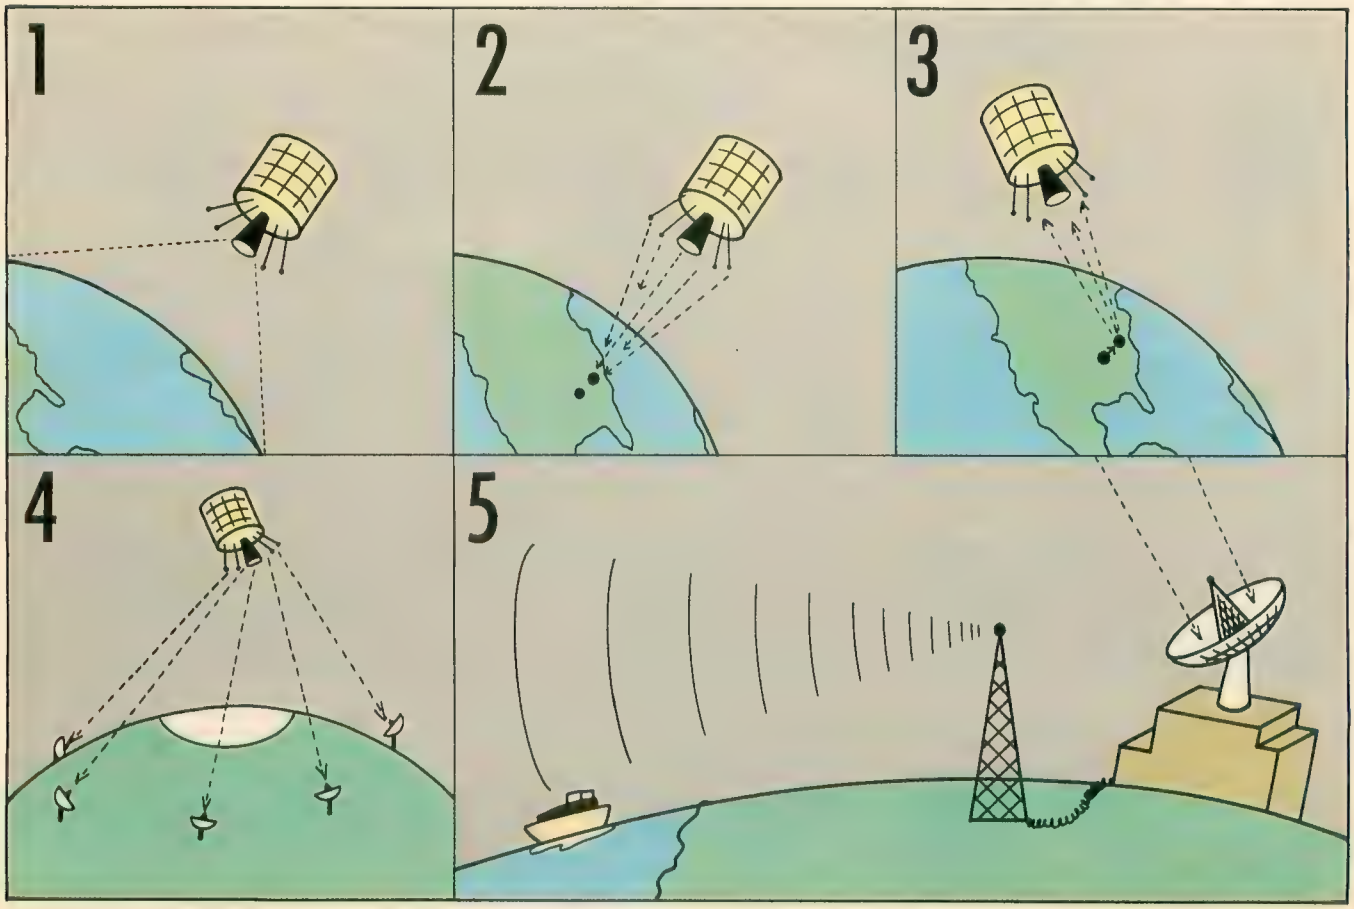


A VAS-equipped GOES satellite.

5. The Field Service Stations receive the satellite transmissions, record them on a high-quality tape and print the associated images on a facsimile machine. Meteorologists at the Field Service Station use these images to plot weather maps and make their forecasts. Finally, the Field Service Station transmits these images (satellite photos as well as weather maps) to ships at sea and other users (like us). These images are transmitted via the shortwave radio bands.

The National Meteorological Center in Washington, D.C. also transmits weather maps and charts in this fashion.

More than 1,000 WEFAX stations are located in 80 countries throughout the world. Foreign stations often use GOES information, or they may relay pictures from their own geostationary weather satellites. Japan, for example, operates the GMS satellite at 140 degrees longitude. This satellite covers the western Pacific. The Soviet



GOMS satellite monitors the Indian Ocean (The USSR also uses a polar orbiting satellite, called METEOR). You could try receiving the European Space Agency's Meteosat broadcasts. Meteosat, located at 0 degrees longitude, covers the eastern Atlantic ocean.

The Field Service Station transmitters in the United States include:

NMC	Point Reyes, California
NAM	Norfolk, Virginia
KVM	Honolulu, Hawaii
NPM	Pearl Harbor, Hawaii
NOJ	Kodiak, Alaska
WWD	La Jolla, California
NFM	Boston, Massachusetts

FINDING A WEFAX SIGNAL

Tune to one of the frequencies given below with a good shortwave receiver capable of receiving SSB (single sideband).

If you've never heard the chirping of a WEFAX signal, Listing 4, a WEFAX simulator, will help you identify them. Type in Listing 4, WESIM.BAS, check it with TYPO II and SAVE a copy to disk before you RUN it. When RUN, the program generates a simulated WEFAX signal. Keep this sound in mind when hunting for *real* WEFAX signals in the shortwave bands. WESIM.BAS also identifies the different parts of a WEFAX signal, such as the "start tone," the "phasing pulses" and the parts which contain picture information.

If you live in the Western United States, try to receive U.S. Coast Guard Station NMC, in Point Reyes, Ca. NMC broadcasts on these frequencies (kHz.): 4346.0, 8682.0, 12730.0, and 17151.2 at the following times (GMT): 0100, 0300, 0500, 1500, 1715, 2000 and 2330.

NPM, in Pearl Harbor, Hawaii, (which **Antic** nicknamed "old reliable") transmits WEFAX 24 hours a day on 14.879 mHz. Like most WEFAX broadcasts, it is easiest to receive in the evenings.

Those living in the eastern United States should look for NAM, the U.S. Naval Communications Station in Norfolk, Virginia, or CFH, located in Halifax, Nova Scotia.

Dish antenna on the roof of San Francisco's National Weather Service office. **Antic** staffers (from left) Charles Jackson, Gigi Bission and Patrick Bass.

NAM Schedule

Frequency (mHz.)	Time (GMT)
3.357	2000-1400
4.975	24 hrs.
8.080	24 hrs.
10.865	24 hrs.
16.410	1400-2000
20.015	1200-2400

You can also use **Antic's** WEFAX Decoder program to receive "wirephotos" from news agencies such as the Associated Press. Press photos can be found on many shortwave frequencies. These photos are transmitted at 60 lines per minute. We should point out that if you receive a "non-broadcast-class" signal (such as private communications), the Federal Communications Act states that you may not "divulge to any other party that such a transmission exists, or the content of the transmission 'intercepted'." This rule does *not* apply to the WEFAX signals described in the article, but it *does* cover other satellite transmissions you might receive with the our WEFAX Decoder program. These protected transmissions include (but are not limited to) all communications in the 3.7—4.2 gHz. band.

For a complete listing of WEFAX and news photo stations, refer to the *Shortwave Facsimile Frequency Guide*, by Joop Balneger and Michiel Schaay. It is available for $14.95 from Universal Electronics, Inc., 4555 Groves Road, Suite 13, Columbus, OH 43232. (614) 886-4605.

NAFAX

If you don't own a shortwave radio, it's possible (but not inexpensive) to receive WEFAX transmissions over the telephone. The National Facsimile Circuit (NAFAX) lets you tie into the National Weather Service (NWS) circuit, which broadcasts WEFAX satellite photos and weather maps 24 hours a day at 120 lines per minute.

Access to the NWS circuit is free, but you have to pay AT&T Longlines for the "Receive-Only Extension" of the NAFAX circuit. (You'll also need a FAX permit from the NWS.) The installation fee for a NAFAX extension is approximately $222. Monthly rates begin at $36.80. For more information, contact AT&T at (800) 222-0400, ext. 3557.

FACSIMILE

Facsimile machines were developed to transmit documents and black-and-white photographs over radio and telephone lines. The satellite weather maps you see on TV are transmitted this way, as are the "wirephotos" you see in newspapers and magazines.

Facsimile technology is a product of the 1930s. The earliest facsimile machines were hand-cranked and used spinning metal drums and brass gears. Later models featured electric motors.

Although most modern weather satellite stations use high resolution digital laser facsimile computers to produce their maps and photos, mechanical facsimile recorders are still the machines of choice among WEFAX enthusiasts. Mechanical facsimile machines are relatively inexpensive (starting at under $100) and can easily exchange pictures with state-of-the-art computerized facsimile machines.

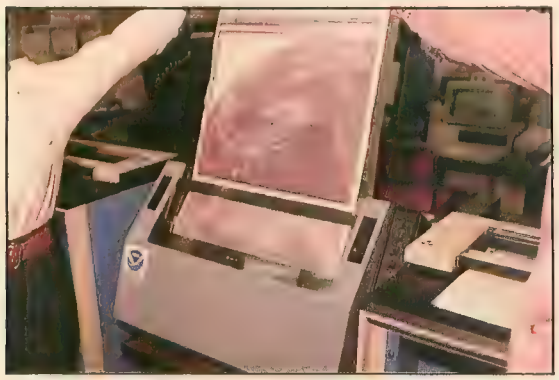
Although these two types of machines are separated by more than 50 years of technical advances, the principles behind them are the same. In fact, most WEFAX programs for microcomputers, such as the pro-

continued on next page

grams in this issue, are modeled after mechanical facsimile equipment.

The heart of a mechanical facsimile transmitter is a rapidly spinning drum. The photo to be sent is wrapped around this drum, much like a label is wrapped around a coffee can. A standard drum measures 152 mm in diameter (about 6 inches) and is at least 660 mm long (about 26 inches).

The drum normally spins at 120 RPM, although speeds of 60 and 180 RPM are also used. Since one revolution is equal to one scan line, drum speeds are usually reported as lines per minute (LPM). As the drum spins, a small arm creeps alongside it, moving about one inch with every 96 revolutions. The arm carries a small light and a photocell. The photocell scans each line of the image, one dot at a time, and generates a small electric current for each dot. The current is proportional to the darkness of the dot. The transmitter broadcasts this varying current as a varying tone.



As each WEFAX image is transmitted, it is reproduced on high speed plotters at the weather service office.

Darker dots produce lower-pitched tones, while lighter-colored dots yield higher-pitched tones. If we played a musical scale into our WEFAX machine, for example, we'd see a gray scale ranging from black to white. The scale would have to be played very quickly, though. A drum speed of 120 LPM means that WEFAX images are being transmitted at two lines per second. A facsimile receiver running at the same speed can intercept these signals and reverse the process to generate a copy of the image.

In practice, WEFAX tones range from 1500 Hz. (black dots) to 2300 Hz. (white dots). WEFAX images also contain a short "dead sector" which corresponds to the left and right margins of the image. This is where the photo is attached to the spinning drum. Since WEFAX transmissions have no timing signals (such as the horizontal sync signals used in TV broadcasts), the dead sector is commonly used to align an incoming picture.

Generally, a WEFAX signal sounds very much like cricket chirping at two chirps per second. Each "chirp" corresponds to a single horizontal scan line of the image.

A standard WEFAX image is composed of 800 of these lines, stacked one on top of the other. Since each scan line is transmitted as a half-second analog signal (at 120 LPM), it can be divided into as many pixels as you please. Of course, a scan line divided into 800 individual pixels will have a much finer resolution than one which is divided into eight.

GOES SATELLITES

British writer and scientist Arthur C. Clarke first proposed the concept of geosynchronous satellites in a 1945 edition of "Wireless World." Such satellites, he speculated, could be used to relay messages from one side of the globe to the other. Since that time, the ring in which geosynchronous satellites *must* be placed has been named the Clarke Zone. To date, more than 150 geosynchronous satellites have been placed in this zone.

WEFAX pictures come from the polar orbiting NOAA satellites or from a Geostationary Operational Environmental Satellite (GOES). GOES satellites, positioned over the earth's equator at an altitude of approximately 22,300 miles, orbit the earth once every 24 hours.

GOES satellites remain in synchronous orbits around the earth. In other words, geosynchronous satellites don't rise or set. Day and night, they remain in the same position, relative to the earth. Thus, ground stations only have to aim their antennas once.

Left to their own devices, GOES satellites will stay frozen in their assigned positions in the sky, apparently "hovering" over whatever line of longitude they were assigned. These satellites may be easily moved, however, to suit the needs of scientists and meteorologists. A ground station may move a GOES satellite by temporarily altering its altitude; a GOES satellite brought closer to the earth will appear to drift east, while one moved away from the earth will drift west. Once repositioned, the ground station returns the satellite to its original altitude.

The newer GOES satellites are shaped like large cylinders. Built by the Hughes Aircraft Company, each measures 7 feet in diameter, nearly 12 feet in length, weighs 1,382 pounds and costs more than $57.5 million. They are powered by external solar cells which provide up to 320 watts of electric power.

Although six GOES satellites were launched, only one remains operational. Previously, the United States was monitored by two GOES satellites. GOES-5, launched in May 1981, monitored the eastern half of the country. GOES-6, launched in April, 1983, observed the western half.

GOES-5 failed in July, 1984. Since that time, NOAA has moved GOES-6 to 108 degrees W. longitude to monitor the entire country. During hurricane seasons, however, GOES-6 is moved to 98 degrees W. longitude to provide increased coverage of the Caribbean regions.

GOES-7, which would have replaced GOES-5, was launched from Cape Canaveral on May 3, 1986. Moments after launching, though, the Delta booster rocket failed, and the spacecraft had to be destroyed. Spokesmen for the Kennedy Space Center said that no further GOES launches are presently scheduled.

GOES INSTRUMENTATION

The primary instrument aboard the early GOES satellites was a Visible and Infrared Spin-Scan Radiometer (VISSR), which is akin to a facsimile machine's spinning drum and photocell.

VISSR can transmit either visible or infrared images of the earth. With this technology, GOES satellites could supply weather photos both in daylight and at night, 24 hours a day, at a rate of one picture every 30 minutes.

Between 1980 and 1983, a more advanced series of GOES satellites was launched. GOES-4 through GOES-6 were each equipped with a 16-inch (40-cm) telescope capable of optical and infrared viewing, as well as a VISSR-based Atmospheric Sounder (VAS). Atmospheric sounders were first used on the Nimbus weather satellites to measure the air's temperature and moisture content at various altitudes.

NOAA technicians Bill Pettyplace (l.) and Bob Levno check the quality of the weather charts transmitted that morning.

Satellites with VAS can transmit an interlaced signal which contains both visible and infrared images of the earth. Even-numbered "chirps," for example, contain the optical image, while odd-numbered "chirps" carry the infrared image. This is called "simultaneous imaging." In other words, a VAS aimed at one section of the earth will simultaneously create two different types of pictures (infrared and optical) at the same time (See *Figures 1 and 2*).

VAS operates 24 hours a day, observing clouds, cloud heights, vertical temperature distributions and wind patterns. As infrared and optical images highlight different aspects of the earth, meteorologists armed with both types of images have nearly twice as much information with which to make a forecast.

SIGNAL RELAYS

Although it's possible to receive images directly from the satellite, the process is often too costly and too inconvenient for most WEFAX users.

Weather satellites usually transmit images on S-band microwave frequencies (about 1691 mHz.). Although such frequencies experience little interference and are excellent for satellite-to-ground communications, they are not very practical either for earth stations to use when broadcasting to ships, or for other WEFAX users. For one thing, at the time most of today's ships were built, the necessary microwave receivers were too large, too expensive and too difficult to maintain. But this situation is being reversed with the advent of satellite TV.

However, signals transmitted over VHF and microwave frequencies may only travel as far as the eye can see. "Line-of-sight" transmission poses little problem to the satellite-based transmitter—its line-of-sight spans nearly half the globe. Earth-based stations, on the other hand, are not as fortunate. A ship would have to be in sight of a transmitter in order to receive a picture from it.

This is why the final WEFAX signal is broadcast in the shortwave bands. Shortwave frequencies, though slightly noisier, have a much greater range. Many shortwave radio enthusiasts commonly receive signals from the other side of the world.

Shortwave radios are also less expensive than their S-band counterparts. Although S-band satellite receivers are quite expensive and usually require special parabolic dish antennas, shortwave receivers are relatively inexpensive. All you need is a shortwave receiver capable of receiving SSB (Single Sideband)—the kind most amateur radio operators use—and an appropriate interface to decode the WEFAX signals. A suitable second-hand receiver can be purchased for as little as $75-$100.

FIRST-HAND SIGNALS

Although shortwave WEFAX stations use many formats, protocols and frequencies to relay WEFAX pictures, geostationary satellites adhere to a single format. All geostationary meteorological satellites use a common downlink frequency of 1691.0 mHz. The format of WEFAX data is identical for all satellites. Many WEFAX enthusiasts take advantage of this standard to receive images first hand.

Ambitious readers handy with a soldering iron may want to try receiving pictures **directly** from space! "An S-Band Receiving System for Weather Satellites" (*QST Magazine*, August 1980, pp.28-33), gives instructions for downconverting the 1691.0 mHz. downlink signal to a 20.6 mHz. signal, which can be received by standard shortwave radios.

You could also try receiving WEFAX from some of the polar orbiting satellites. These satellites are in sun-synchronous orbits at altitudes ranging from 435 to 1055 miles above the earth and have orbital periods between 98 and 120 minutes. A "sun-synchronous" orbit refers to the circle traced by the orbiting satellite. To an observer standing on the sun, this circle would look like a stationary ring around the earth. To an observer on the earth, a sun-synchronous satellite would pass overhead at about the same times every day.

The NOAA polar orbiters transmit satellite pictures on 137.5 and 137.62 mHz. The Soviet METEOR satellites transmit pictures on 137.3 and 137.15 mHz.

Antic would be eager to hear from readers having success with such projects.

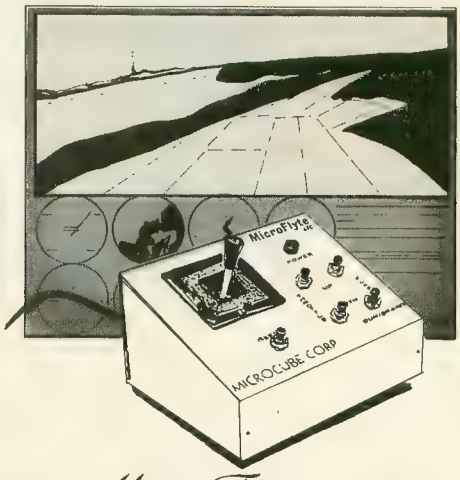
A REVOLUTION IN FLYING



THE MicroFlyte JOYSTICK

A unique product designed for use with FLIGHT SIMULATOR II™ to give you accurate and proportional control. Includes control Yoke, Throttle, Flaps, Brakes, Gun and Elevator trim.

OTHER FEATURES:
- Software program drivers for other Flight programs available soon
- Use with User generated BASIC programs
- Use with User generated assembly language programs

This is the **ONLY** fully proportional, continuously variable joystick control for Flight Simulator II. Now your home computer can be a truly realistic flight simulator.

"...I flew all over the map with one landing after another and no mishaps." K.C.

"...I am getting more use out of Flight Simulator now and will continue thanks to your joystick" R.T.

WARNING: Use of the MicroFlyte joystick may cause Flight Simulator addiction. Order with caution.

REVIEWED BY CHRIS MANY

MUSIC STUDIO

Since the first days of Atari, there have been music programs. I spent hours hunched over a membrane keyboard and using the original Atari Music Composer cartridge, entering the computer equivalent of music notation into my old Atari 400. While I got a kick out of playing duets with my computer, I found it tedious typing in every note from my computer keyboard. I wish that I'd had Activision's **Music Studio** then. For both novices and experienced musicians, Music Studio is an easy-to-use music composer that will have you playing songs on your Atari within minutes.

Separate versions of Music Studio have been released for 8-bit Ataris ($34.95) and for the ST ($49.95). The 8-bit version uses a joystick instead of a mouse, and the ST graphics are far superior. But the most significant difference is that the 8-bit version has no MIDI option. This is unfortunate, because the software could easily have been made compatible with Hybrid Arts' MIDITRACK hardware interface for 8-bit Atari computers.

Music Studio consists of five screens from which to compose, edit and playback music. Entering music is very easy: select the type of note you want to enter with the joystick, and place that note on the staff by pressing the button. You can enter a lot of music quickly this way, and you hear each note as you move around the staff. Entering other music notations such as sharps, flats, rests, time and key signatures, etc. is done the same way.

You can even have lyrics to your songs. Up to three lines (or verses) can be added to scroll right along with your musical score. Is the key or range too high or too low? No problem. Music Studio transposes the entire song to a new key. Other features include inserting, copying and moving blocks of music—much like working with word processors.

Since not everyone can read standard musical notation, Music Studio has a fun option which allows you to write music in a graphic representation called the Music Paintbox. You "paint" your song on the screen using different colors. The duration of your notes is indicated by the length of the color bars you use—the longer the bar, the longer the note and vice versa. Then Music Paintbox converts your musical "picture" to notes. Kids just love playing around with these colorful patterns.

CHOOSE SOUNDS

You have a choice of 15 instruments, ranging from flute to bass to snare drum, and though you might be hard pressed to hear the difference between the Atari harmonica and saxophone, you still have plenty of distinct sounds to chose from. There are other options which expand the musical playback beyond the sounds provided with Music Studio. One is called the Design Instrument screen, with which you can graphically manipulate the Atari voices.

Although many factors go into creating a given sound, some of the basic components can be edited easily. Using a graph onscreen with the vertical axis representing the volume of a tone and the horizontal axis showing the duration, four key parameters can be changed through the use of control sliders. These parameters affect the sound dramatically. By experimenting with the Attack, Decay, Sustain or Release of a tone you can change a fuzz guitar into a bell-like piano or a mellow flute. You are dealing with the internal voices of the Atari, so don't expect to create a complex harmonic sound like a Steinway grand piano. But it's relatively easy to create something new and different. Other features on this screen include selecting the range for the instrument, naming, copying and saving sound files.

Mercedes McDonald

ST MIDI

I've saved the best for last. The Atari ST has two MIDI ports. You can enter the world of MIDI through Music Studio's MIDI Parameters screen.

MIDI (Musical Instrument Digital Interface) allows synthesizers to communicate among themselves, or a computer to communicate with synthesizers. For example, if you had two keyboards MIDI'd together, playing a note on keyboard 1 would trigger the same note on keyboard 2. This way, you can chain many synthesizers together and create thick sounds by playing one keyboard.

Additionally, MIDI has 16 separate channels. Much like a telephone cable which carries hundreds of phone calls at once, MIDI can carry separate musical information to synthesizers tuned into specific channels.

You will need a synthesizer with MIDI capabilities to use this feature, but there are many available at reasonable prices, such as Casio's CZ-101. By hooking up your synthesizer to your ST, you can play your Music Studio songs through these powerful musical instruments.

Music Studio comes somewhat configured to work with the CZ-101 and provides sound modifications for this specific synthesizer. You can enter notes directly from your music keyboard into Music Studio, which makes life much easier for musicians. But you'll still need to change the note duration manually. MIDI channels (1-16) can be assigned to each instrument, so that if you have a multiple synthesizer setup, or a synthesizer that plays more than one sound simultaneously, you can have different instruments playing separate lines.

Although this program is not really geared toward the professional musician, it is a fine addition to the growing list of Atari music programs for home use. It's easy to use, and its variety of options makes it one of the better home music programs available.

$5 TALKING DISK

OVER 100 WORDS in vocabularies that you can put into your own programs! No extra hardware required. Sample programs include:

- Talking four-function calculator — choose English, Spanish, or German.
- Talking keyboard — letters and punctuation in English.
- Demonstration of voice editing.

The $5 Talking Disk is available for Commodore 64, 128, Atari 800, 800XL, 130XE, and Apple II+ (64K), IIe, and IIc.

If you want to make your own vocabularies, in any language or accent, then you must have a VOICE MASTER for processing speech input. VOICE MASTER lets you do much more: YOU CAN RECOGNIZE SPOKEN COMMANDS and WRITE MUSIC AS YOU HUM! And affordable too — under $90 including the headset and microphone.

Send $5 for the talking disk. Prepaid orders only. Includes postage. ($7 outside USA, Canada, and Mexico.) Information on VOICE MASTER will accompany your disk. Or you can call or write for VOICE MASTER information separately. Please specify computer make and model with your order.

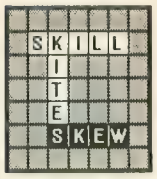
WORD FOR WORD™

NEW

A crossword game for the ATARI ST!



It's a challenging new game in which the players take turns creating words on a playing board. Here's what reviewers have to say:

"...the whole game design is extremely user-friendly...a winner." ANALOG COMPUTING, June 1986

"...It's easy to use the mouse to design and save your own board layout...makes the game even more fun." ANTIC, April 1986

"...I am very impressed with Word for Word...full utilization of GEM...solid performance...a joy to play...attention to detail...excellent product."
ST APPLICATIONS, Jan.-Feb. 1986

BUILD THE WEFAX INTERFACE

by BILL MARQUARDT, **Antic** Technical Assistant

Here are the instructions for building the WEFAX hardware interface. This simple circuit will work with both the 8-bit and ST versions of the WEFAX program. Intermediate electronics tinkerers should be able to build the $20 project in a day with parts from a local electronics store or Radio Shack.

Before your Atari can receive WEFAX signals, you must build the WEFAX interface, a simple circuit which lets your radio "talk" to your Atari. You'll need only basic soldering skills and the ability to work from a circuit diagram to build this project. Experience with shortwave or amateur radio would also help. If you're lost, ask around at the next users group meeting. Someone there is likely to have the necessary skills and share your interest.

Antic spent several months experimenting with different circuits and testing various software designs for our WEFAX project. Keeping low cost, versatility, reliability and ease of use in mind, we chose the accompanying circuit (*Figure 1*) as best. It is a variation of the linear FM detector found in *Semiconductor Reference Guide*, published by Radio Shack.

Figure 1

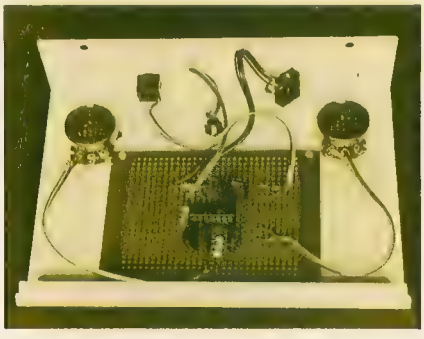

Figure 2

Antic's WEFAX interface. On the right is the finished interface. On the left, the inside of the interface, showing construction details.

Although this circuit is designed for the 8-bit version of the WEFAX program, you can build a simple cable (*Figure 2*) and use it with the ST WEFAX program.

This project is relatively simple and should cause the average experimenter no problems. Power for the circuit comes from the 5-volt pin of joystick port 2. This decreases the possibility of faulty construction damaging your computer. As with any hardware project, careful construc-

tion techniques will greatly improve your chances of success.

The heart of this circuit is a XR 2211 FSK Demodulator/Tone Decoder chip. It's somewhat expensive, but it considerably reduces the number of other components you'll need—which in turn reduces the overall cost of the project. Currently, Radio Shack sells this chip for about $6.

HANDLING THE CHIP

Make sure you use a compatible socket for the XR 2211 — and don't insert the chip until the socket has been soldered in place! If you're a beginner, the socket eliminates the chance of the chip overheating while you're soldering. If you're an advanced "hardware hacker," the socket will let you remove the XR 2211 chip for use in other projects.

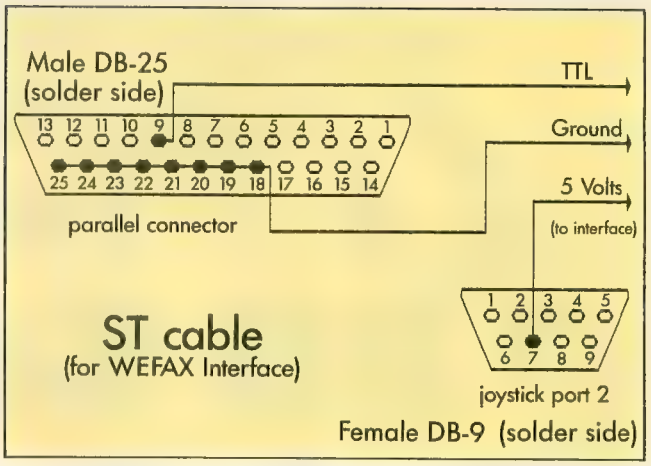
Although a standard DB-9 (joystick) connector fits comfortably into the front of an Atari 400 or 800, commercial DB-9s may require some sort of an extender to reach the recessed joystick ports on the XL and XE models. In this case, you must bend back the DB-9's metal tabs before it will fit. Or if you own the PaperClip word processor from Batteries Included, you can use the black extender from the program's "key."

Unfortunately, you cannot use the plug from an old Atari joystick because there is no connection to the 5-volt pin (pin 7). If you use a plastic hood with your DB-9 connector, it may need trimming.

TESTING THE CIRCUIT

Once you've constructed the interface, you can test it with Listing 5, WETST.BAS. Type in this listing, check it with TYPO II and SAVE a copy to disk before you RUN it. This BASIC program generates a wavering tone which we'll use to test our circuit. Make a 2-3 minute tape recording of this tone on a *good* tape recorder—preferably one which plugs into an AC outlet. Battery-powered tape recorders yield unreliable results.

Once you've made this test tape, stop the WETST program and run the main WEFAX Decoder program. Now, we'll use our test tape instead of a WEFAX signal. Plug your WEFAX interface into joystick port 2, and connect the audio output of your tape player to the input port of the interface. If you've built the circuit correctly, the test tape will produce a *striped pattern* on your WEFAX screen.

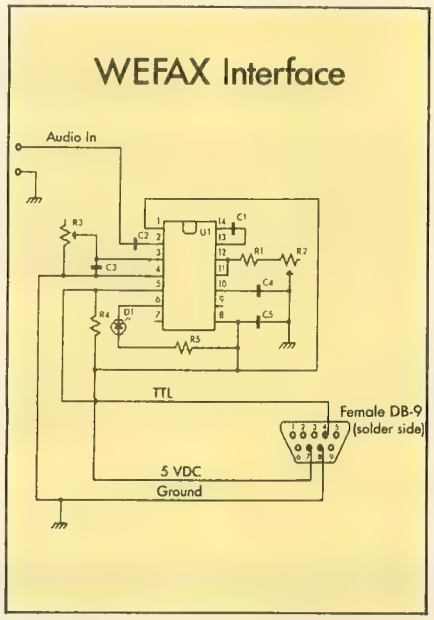


This is the Atari ST adapter cable needed when using the WEFAX interface with any Atari ST computer. You don't need this for the 8-bit computer.

SHIELDING

Although we've had little trouble with our open-air prototype, you can mount your finished circuit board inside a metal box to shield it from interference. If you still have interference problems, use shielded cables.

The audio jack on your radio receiver should also be volume-controlled, or else you might need to add an attenuating potentiometer of 5K or 10K Ohms on the audio input



Wiring diagram for Antic's WEFAX interface. This circuit works with either the Atari 8-bit or Atari ST computers.

to the circuit board. The circuit board itself can be of any of the various perfboards at Radio Shack or other stores.

The timing for the XR 2211 is provided by the combination of resistor R1 with potentiometer R2 and capacitor C1. Adjusting R2 varies the center frequency of the chip's internal oscillator. The values of these components were chosen to give us a frequency within the range of our WEFAX information. The formula is:

$f^0 = 1/CR$

PARTS LIST

		Radio Shack Part #	Price

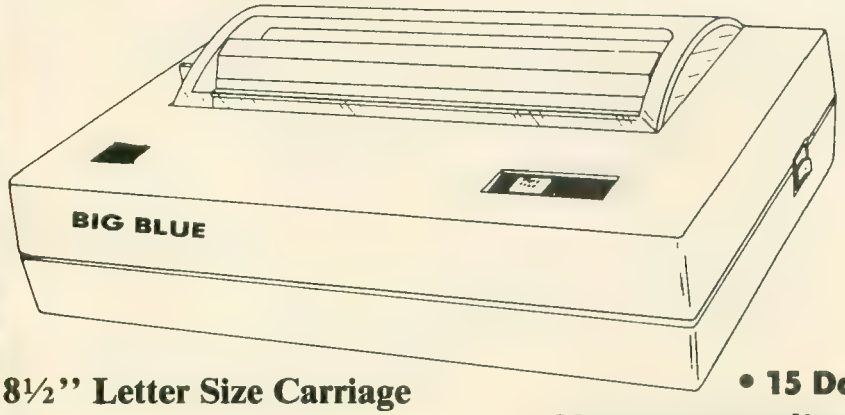
8½" Letter Size 80 Column Printer Sale

List $199.00 Sale $39.95

• Word Processing • Program Listings • Graphics • Quiet Operation • Upper and Lower case • All points addressable Graphics • Underline • Enhanced • Much much More



Super Quality

This printer was made by **Canon®** for one of the largest computer manufacturers in the world. The Big Blue printer comes ready to hook up to the serial port of the **IBM®PC** jr. Plus with low cost adapter cables you can connect the Big Blue printer to the **IBM®PC, IBM®XT, IBM®AT, Apple®II,IIe,IIc, Commodore®** 64,128, **Atari®**, plus many more.

8½" Letter Size Carriage

• 15 Day Free Trial

• 90 Day Immediate Replacement Warranty

Now you can have a full fledged 8½" letter size 80 column printer for less than the cost of a large box of paper. This printer uses advanced thermal technology to print upper and lower case (with true lower descenders), underline, enhanced, all points addressable graphics (works with Printshop) plus More. Print out pictures, program listings, wordprocessing pages, graphics and more. Perfect for the homeowner or student and definitely affordable. Fantastic Printer at an unbeatable price. List $199.00 **Sale $39.95**

Intelligent Commodore Interface— Allows you to connect the Big Blue printer to the printer port of the Commodore 64 and 128 computer. Print Commodore graphics, use Printshop, Word processors and more... List $49.95 **Sale $24.95**

Intelligent Atari Interface— Allows you to connect the Big Blue printer to Atari computers (except 1200). Print Atari graphics, Printshop ,word processors, and more... List $49.95 **Sale $24.95**

IBM®, Apple® RS-232 Adapter— Adapts the Big Blue printer to be used with any RS-232 port. List $19.95 **Sale $9.95**

Paper (2 Rolls) List $19.95 **Sale $9.95**

Add $10.00 for shipping, handling, and insurance. Illinois residents please add 6¼% sales tax. Add 20.00 for CANADA, PUERTO RICO, HAWAII, ALASKA, APO-FPO orders. All orders must be in U.S. Dollars. WE DO NOT EXPORT TO OTHER COUNTRIES EXCEPT CANADA. Enclose Cashier Check, Money Order or Personal Check. Allow 14 days for delivery, 2 to 7 days for phone orders, 1 day express mail. Prices & Availability subject to change without notice.

VISA — MASTER CARD — C.O.D. C.O.D. on phone orders only.

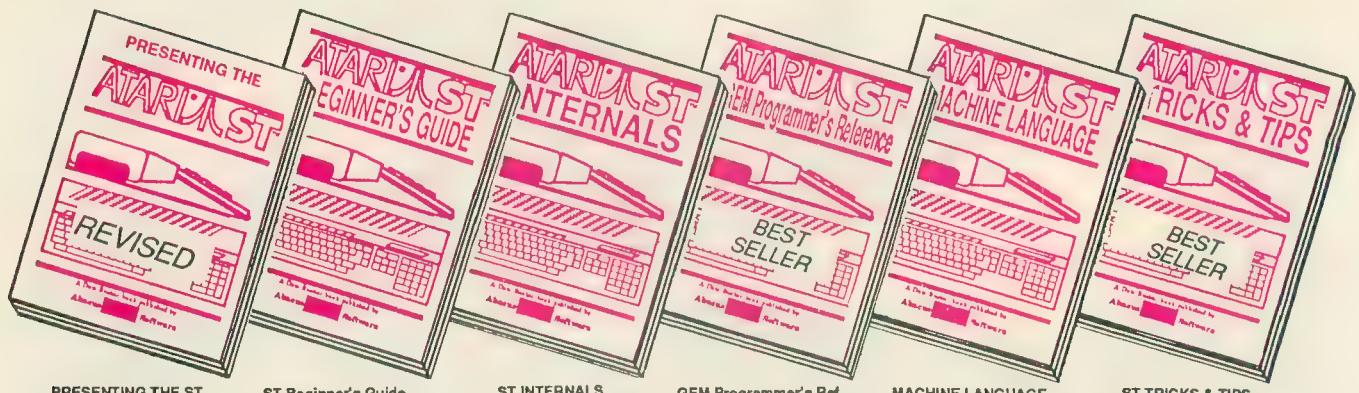
Top shelf books from Abacus



PRESENTING THE ST
Gives you an in-depth look at this sensational new computer. Discusses the architecture of the ST, working with GEM, the mouse, operating system, all the various interfaces, the 68000 chip and its instructions, LOGO. 200pp $16.95

ST Beginner's Guide
Written for the firsthand ST user. Get a basic understanding of your ST. Explore LOGO and BASIC from the ground up. Simple explanations of the hardware and internal workings of the ST. Illustrations, diagrams. Glossary. Index. 200pp $14.95

ST INTERNALS
Essential guide to the inside information of the ST. Detailed descriptions of sound and graphics chips, internal hardware, I/O ports, using GEM. Commented BIOS listing. An indispensible reference for your ST library. 450pp $19.95

GEM Programmer's Ref.
For serious programmers needing detailed information on GEM. Presented in an easy-to-understand format. All examples are in C and assembly language. Covers VDI and AES functions. No serious programer should be without 410pp $19.95

MACHINE LANGUAGE
Program in the fastest language for your ATARI ST. Learn 68000 assembly language, its numbering system, use of registers, structure & important details of instruction set, and use of internal system routines. Geared for the ST. 280pp $19.95

ST TRICKS & TIPS
Fantastic collection of programs and info for the ST. Complete programs include: super-fast RAM disk; time-saving printer spooler; color print hardcopy; plotter output hardcopy; creating accessories. Money saving tricks and tips. 260pp $19.95

ST GRAPHICS & SOUND
Detailed guide to graphics and sound on the ST. 2D & 3D function plotters, Moiré patterns, graphic memory and various resolutions, fractals, recursion, waveform generation. Examples written in C, LOGO, BASIC and Modula2. 250pp $19.95

ST LOGO GUIDE
Take control of your ST by learning ST LOGO—the easy to use, powerful language. Topics include: file handling, recursion-Hilbert & Sierpinski curves, 2D and 3D function plots, data structure, error handling. Helpful guide for ST LOGO users. $19.95

ST PEEKS & POKES
Enhance your programs with the examples found within this book. Explores using different languages BASIC, C, LOGO and machine language, using various interfaces, memory usage, reading and saving from and to disk, more. 280pp $16.95

BASIC Training Guide
Thorough guide for learning ST BASIC programming. Detailed programming fundamentals, commands descriptions, ST graphics & sound, using GEM in BASIC, file management, disk operation. Tutorial problems give hands on experience. 300pp $16.95

BASIC to C
Move up from BASIC to C. If you're already a BASIC programmer, you can learn C all that much faster. Parallel examples demostrate the programming techniques and constructs in both languages. Variables, pointers, arrays, data structure. 250pp $19.95

3D GRAPHICS
FANTASTIC! Rotate, zoom, and shade 3D objects. All programs written in machine language for high speed. Learn the mathematics behind 3D graphics. Hidden line removal, shading. With 3D pattern maker and animator. $24.95

Abacus Software

P.O. Box 7219 Dept. A9 Grand Rapids, MI 49510 - Telex 709-101 - Phone (616) 241-5510

NEW OWNERS COLUMN

Lesson 6: Subroutines

by DAVID PLOTKIN, **Antic** Contributing Editor

This series, which started in the March, 1986 issue, teaches beginners how to program in BASIC on all Atari 8-bit computers such as the 800XL and 130XE. Antic Contributing Editor David Plotkin is a chemical engineer.

Up to this point, all our programming examples have RUN in the order shown by their line numbers. Line number 10 will execute before line number 20, and so on. When you use the LIST command to put the program on the screen, the order in which the lines are displayed is also the order in which the program will execute.

Sometimes, however, it is advantageous to "skip around" a program, executing statements in a different order than the line numbers specify. For example, you might need to execute different groups of statements based on a condition in the program. This is often tested for by an IF/THEN statement.

Skipping around is also useful when you need to execute the same set of statements many times from different parts of the main program because these statements do something particularly useful.

The technical name for "skipping around" in a program is **branching**. Two commands enable you to branch from one section of a program to another: the GOTO command and the GOSUB/RETURN command. The GOTO command will be discussed next month.

GOSUB/RETURN

When you need to execute the same task many times from different places in your program, you have two choices. The first is to put the section of BASIC lines that performs the task everywhere you need it. The alternative is to use a subroutine. A subroutine is a module (part) of a BASIC program that can be accessed from anywhere in the program.

Before branching to your subroutine, your Atari makes a note of its current place in your program. Once the subroutine is complete, your Atari refers back to this note and returns to the proper place in your program. This process is like marking your place with a bookmark before flipping ahead to read another chapter. Every time your program processes a GOSUB, it adds another entry into its list of "bookmarks." Every time your program processes a RETURN, it jumps back to the corresponding GOSUB statement and removes it from its list.

Subroutines are extremely useful, and calling and defining subroutines is quite easy. To call a subroutine, you use the format GOSUB line number. Thus, to call a subroutine beginning at line 100, you would type GOSUB 100. The subroutine itself can be anywhere in the program. But it must end with a RETURN statement. This causes the program to branch back to the next statement after the GOSUB.

This is shown in the following short example of the use of subroutines to compute the square and square root of a number:

```
10 DIM ANSWR$(1)
20 PRINT "WHAT NUMBER ":INPUT A:
GOSUB 100
30 PRINT "THE SQUARE OF THE NUMB
ER IS ";X
40 GOSUB 200:PRINT "SQUARE ROOT
OF THE NUMBER IS ";Y
50 A=Y:GOSUB 200:PRINT "FOURTH R
OOT OF THE NUMBER IS ";Y
60 PRINT "ANOTHER NUMBER (Y OR N
)":INPUT ANSWR$
70 IF ANSWR$="Y" THEN GOSUB 20
90 END
100 X=A*A:REM SQUARE SUBROUTINE
110 RETURN
200 Y=SQR(A):REM SQUARE ROOT SUB
ROUTINE
210 RETURN
```

Note that when you GOSUB 100 in line 20, the RETURN at line 110 branches back to the next statement after the GOSUB, which is the first statement in line 30. When you GOSUB 200 in line 40, the RETURN at line 210 branches back to the next statement after the GOSUB—which is still on line 40. The program remembers the location of the GOSUB statement that called the subroutine.

Subroutines are usually grouped at the end of the program's main body. Normally this makes the program eas-

continued on next page

ier to read and use. However, sometimes you don't want to place subroutines at the end of the program. In the example above, the END statement at line 90 is also important. It separates the main program from the subroutines. If you answer N to the question at line 70, then the program will not branch back to line 20. Instead it will "fall through" to line 90 and stop. If line 90 wasn't there, the program would enter the subroutine at line 100. An error would occur when the RETURN at line 120 is encountered, since the program doesn't know where to RETURN to.

ON GOSUB

A powerful variation of GOSUB is the ON GOSUB command. This command branches to one of the line numbers, in a list of line numbers, based on the value of a variable or expression:

```
10 ON A GOSUB 100,200,300,
   400,100,100
```

The variable A must evaluate to an integer. The statement above will GOSUB line 100 if A=1, line 200 if A=2, line 300 if A=3, and so on. The portion of the statement between ON and GOSUB may be a simple variable (such as an A) or it may be a complex expression such as INT(A*2).

The list of line numbers following GOSUB should have as many elements as there are possible values of the variable or expression. Note that the same line number can be used several times if you want the program to GOSUB the same place for several different values of the variable or expression.

If the variable or expression has a value exceeding the number of line numbers listed, the ON GOSUB statement will be ignored. And even if the variable or expression will never have certain values within a series, you must still include line numbers for those values. For example, suppose A could be 2,4 or 6:

```
10 ON A GOSUB 10,100,10,200,
   10,300
```

This statement will branch to lines 100, 200 or 300 based on A having the values of 2, 4, or 6. But notice that numerical "place holders" for A equal to 1, 3 or 5 must still be used, even though you will never execute those branches. Here I have used 10 as a "dummy" line number—the line number of the ON GOSUB statement itself works just fine. If A ever equals 7 or more, this whole statement will be ignored.

```
10 GRAPHICS 0:PRINT :PRINT
20 PRINT "TYPE A NUMBER BETWEEN
5 AND 10, THEN PRESS RETURN"
30 INPUT A:IF A<5 THEN PRINT "NA
UGHTY NAUGHTY!":GOSUB 20
40 ON INT(A)-4 GOSUB 100,110,120
,130,140,150
50 PRINT "A IS GREATER THAN 10!"
:GOSUB 20
100 PRINT "A=5":GOSUB 20
110 PRINT "A=6":GOSUB 20
120 PRINT "A=7":GOSUB 20
130 PRINT "A=8":GOSUB 20
140 PRINT "A=9":GOSUB 20
150 PRINT "A=10":GOSUB 20
```

The above demo program shows the power of the ON GOSUB command. Obviously each of the lines that the program GOSUBs to could be the beginning of a whole block of statements. A prime example of ON GOSUB would be making a choice from a menu.

RECURSION

As explained earlier, subroutines can be called from anywhere in the program. In fact, a subroutine may even call itself. This is a powerful technique known as **recursion**. Unfortunately, this technique also uses plenty of memory. Every time a subroutine calls itself, it adds another "bookmark" entry to the list of places it must return to when complete. Each bookmark represents another level of recursion. If the size of this list exceeds the memory capacity of your computer, your program will crash.

THE LISTING

Recursion can be a difficult concept to understand, so examine this month's listing carefully, especially line 1000. Line 1000 is the first line of a subroutine which GOSUBs to itself. That is, the subroutine beginning at line 1000 calls itself over and over again.

The program is very short, but it demonstrates GOSUB in quite an interesting way. It fills any closed shape with color.

Type in listing 1, NEWOWN6.BAS, check it with TYPO II and SAVE a copy before you RUN it. When RUN, the program draws a closed shape on your screen. Press the [START] key and a small dot will begin filling in the shape. The plotting routines are in a recursive subroutine beginning at line 1000.

A line of text at the bottom of the screen tells you how many times this routine has called itself (which recursion it is working on) and whether the computer is beginning a new level of recursion, or RETURNing from a previous level.

If you plug a joystick into port one, you may draw your own shapes for filling. Move the blinking-dot cursor with the joystick while pressing the joystick button. Erase by moving the cursor without holding the button down. Then place the cursor anywhere inside the shape and press the [START] key.

TAKE-APART

Line 10 sets up the arrays and colors. Line 15 draws a border in blue around the outside of the screen. Lines 20 through 50 allow you to use your joystick to draw a shape on the screen. The PEEK(53279) statement in line 40 reads the console keys. When the [START] key is being held down, this value will be 6. The main subroutine, beginning at line 1000, won't RETURN to line 210 until the shape is completely filled with color. Basically, the subroutine works by using the LOCATE command to examine a dot on the screen and filling each dot with color (if it isn't already filled).

The subroutine calls itself each time it discovers a point which hasn't been filled. It's fascinating to watch the shape being filled in on the screen. There will be long periods of time, both before and after the shape is completely filled, when nothing appears to be happening on the screen. The subroutine may have been called several hundred times, and it can take awhile for the program to execute that many RETURNs! Just be patient, and watch the text window telling you what the computer is doing.

Listing on page 85

WEFAX DECODER

How to use the program, why it works

by PATRICK BASS, **Antic** ST Program Editor

Before I can teach a computer how to do a job, I must learn that job myself. When I had to put together the software to take the signal from Bill Marquardt's hardware and somehow translate it into an Atari-controlled video picture, I first needed to bury myself in a mountain of information that Charlie Jackson and I had gathered in preparation for this project. There were hundreds of questions needing to be answered—questions as basic as, "What frequencies are the signals transmitted on?"

Finally, after many hours of study and mucho lines of code, this WEFAX decoder program will teach your 8-bit Atari how to display satellite weather photographs from space. (*See the* ST WEFAX Decoder *story in this issue for details about the ST version of this program.*—ANTIC ED)

USING THE PROGRAM

(NOTE: This program will not work without the WEFAX Interface hardware described in an adjoining article.)

Type in Listing 1, WEFAX.BAS, check it with TYPO II and SAVE a copy before you RUN it. When RUN, WEFAX.BAS creates a machine language file called WEFAX.EXE and writes it to your disk. *This* is our WEFAX Decoder program. You should copy this file to another disk and name it AUTORUN.SYS. This will be your WEFAX disk. (Antic Disk subscribers will find a copy of WEFAX.EXE on the monthly disk.)

Insert your WEFAX disk into your drive, remove any cartridges from your computer (XL and XE owners should hold down the [OPTION] key), and turn on your computer. The WEFAX program will automatically load and run.

The screen will be mostly white with one text line at the bottom. The text line shows three system values. At the left we have the "K:" value which shows "line skip," which we'll explain later. The center value shows the width of our scrolling display screen, expressed in pixels. You may change this value by pressing the [<] key to decrement, or [>] to increment the pixel count. At the right of the text line is the number of "clock cycles" to be counted between pixel updates. You may change this value by pressing the [−] key to decrement this value, or the [+] key to increment it.

Next, plug the WEFAX interface into joystick port 2, and plug the interface's audio cable into the audio jack of your shortwave receiver. Plug a joystick into port 1. Tune to some of the frequencies mentioned in this issue's *All About WEFAX* article, and choose one that gives the strongest, steadiest signal. Adjust your radio's volume to a moderate level.

Now, set the interface's contrast control (R3, on interface diagram) to its halfway point. Slowly adjust the interface's tuning control (R2) until you see the LED flash in time with the chirp of the WEFAX signal. Start the computer scan by pressing the [R] key. Now readjust the interface's contrast control until you get the clearest possible image on the screen.

Once the image begins appearing on your screen, you'll notice a small vertical bar, (about 1/12 the width of your screen) running from the top of your picture down to the current line. This is the image's "dead sector." Ideally, this should be a perfectly vertical strip, aligned with either the left or right margin of the picture. If it's not vertical, use the [<] and [>] keys, as described below, to align the image. If the dead sector is not at one side

continued on next page

of your image, use the [A] key to slide it to the left.

With a little practice, you'll quickly learn to synchronize the computer to the incoming signal and produce impressive satellite maps and photos. There is enough time at the beginning of each transmission to make the adjustments needed during the phasing period, and weather transmissions occur regularly. Some WEFAX stations broadcast 24 hours a day. Once you have determined a reliable frequency in your area, it's just a matter of being there at the right time.

DECODER COMMANDS

The WEFAX Decoder program recognizes a number of one-key commands. Their functions are outlined below:

A—Adjusts the WEFAX sync mark to the left a small distance each keypress, allowing you to properly "frame" a WEFAX picture.

R—Resets a picture back to the top.

K—Cycles the line skip counter from zero through nine. This number tells the computer how many lines to skip between each line displayed when receiving a WEFAX picture.

C—Clears the screen.

I—Inverses the image currently onscreen.

L—Loads a WEFAX picture into memory.

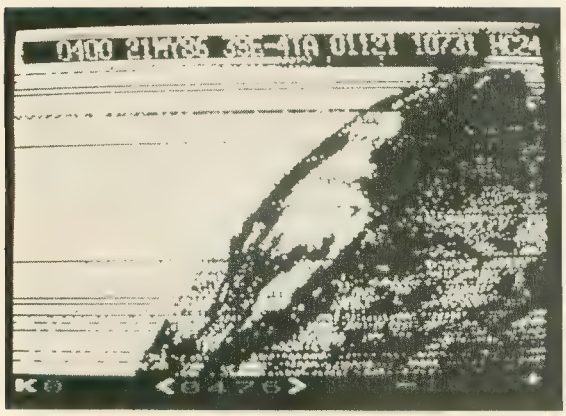
S—Saves a picture. You are prompted to select either (Full) WEFAX format with only two pictures per disk, or (Micro) uncompressed 62-sector Micro-Painter format.

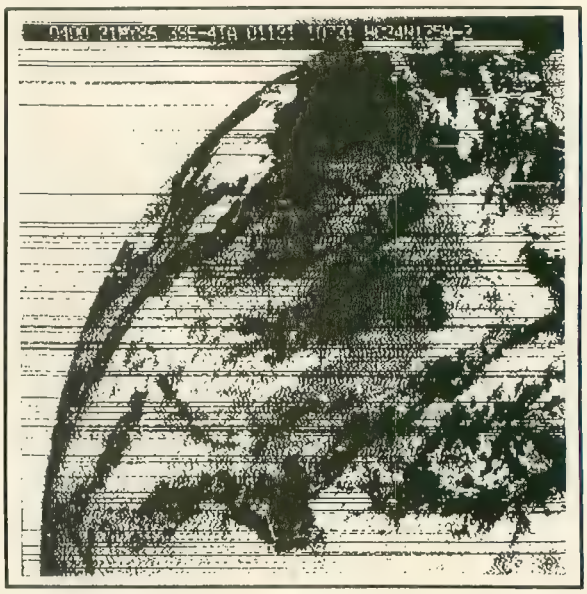
1—Loads in the values for one line-per-second (60 LPM) reception. This covers reception of UPI news photos and some Russian weather satellites (METEOR).

2—Inserts values for a standard two line-per-second (120 LPM) picture.

3—Inserts values for capturing two line-per-second pictures in a format only 321 pixels wide, which allows obtaining a full picture in Micro-Painter format.

P—Prints the picture in memory to any Epson compatible printer. The program has been tested on the Star S and D series, Epson and ADS-2000 printers without fail.





GOES Satellite image (l.) as captured with the 8-bit Wefax Program and (r.) the full image when printed. The horizontal lines are where the signal faded.

SIGNALS FROM SPACE

Just what is it we need to teach the computer to do? A WEFAX picture consists of 800 lines, with each line taking *exactly* one-half second for transmission. The signal is a musical note which varies smoothly from about 1500 hertz to about 2300 hertz, where 1500 hertz will produce black, 2300 hertz will produce white and different tones in between produce grays proportional to the signal note itself.

We may consider two different ways to display pictures. One way is a gray scale proportional to the WEFAX tone transmitted. TV weathermen capture their weather satellite pictures this way. While the results are very impressive, the hardware interface between the radio receiver and the computer is complicated and expensive.

A second way is to produce a picture using only black and white. The resulting pictures aren't as sharp as the gray scale pictures, but the interface to the radio is simpler and cheaper. We used this approach in developing our WEFAX system.

The interface between the radio and the computer consists of an integrated circuit which "listens" to the incoming musical chirps. Our WEFAX system breaks each half-second chirp into nearly 500 individual tones. One to reproduce a WEFAX picture using at a time, the interface examines each tone and determines if it is above or below about 1900 Hertz (Hz). If the incoming tone is below 1900 Hz, a single output line is pulled LOw. If the incoming tone is above 1900 Hz the output line is driven HIgh. The hardware operates fast enough to follow the incoming signal *exactly*.

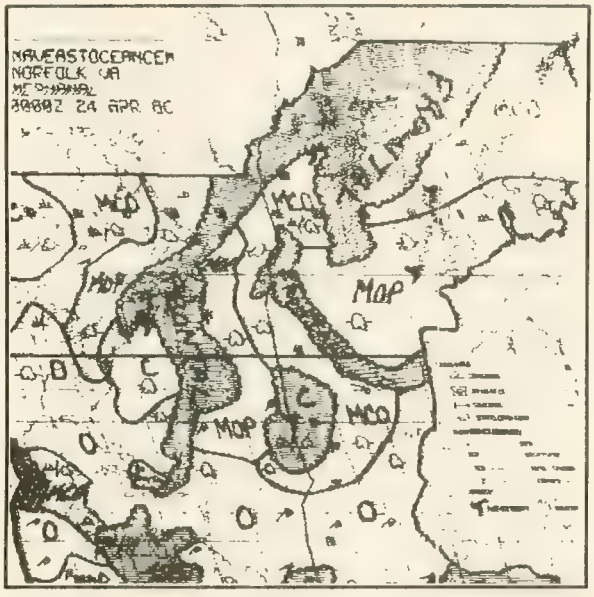
Now, we need to teach the 8-bit Atari to receive, decode, and display each line of incoming picture information. Before we can do this, we must teach the 8-bit Atari to determine *exactly* when a half-second has elapsed.

HARDWARE TIMERS

There are many ways to do this. But for the high precision we required, the best approach was to use the Atari's hardware timers.

Suppose you were told to ring a bell once a minute while you did something else. It wouldn't make much sense to work while staring at a clock, but what if you hired someone to sit beside you and stare at the clock and tap you on the shoulder whenever a minute had passed. It turns out we can do something like that with the Atari.

Deep inside the POKEY chip there are four hardware timers. We select one of these timers and give it a starting value. Then we teach it to decrement this value once every clock cycle, until the value reaches zero. At this time it will reload the starting value, interrupt the 6502, and start counting down all over again. We can have the interrupt "tap us on the shoulder" and tell the computer to run our WEFAX plotting routines.



Reproduced from cassette recording of NAM (Norfolk, VA) showing weather systems in the North Atlantic. The United States can be seen on the left and Europe is on the right. Variations in cassette speed caused the vertical lines in the picture to skew.

In theory, our hardware timers let us come within one-half millionth of a second of precision for timing each half-second interval. In practice this varies somewhat, but the results are quite acceptable.

The default values for a standard two-line-per-second (120 LPM) picture are: 476 pixels wide and 1873 clocks between pixels. Why are these values chosen? Let's do a little math. The Atari 8-bit master clock runs at 1.79 mHz., which means it takes .000000558659217 seconds for each clock "tick". That's a little bit more than one-half millionth of one second. Since we have a screen line 476 pixels wide, and we need to draw each line in one-half of a second, that means we must plot each pixel every .00105042016 seconds—a little bit more than 1/1000 seconds between pixels.

So if we divide the time between pixels (.00105042016 seconds) by the length of one clock cycle (.000000558659217 seconds), our answer (1880) should be how many clock ticks to count between pixel updates. In actual practice, however, the value needed is 1873, because the computer uses some clock time to respond to the interrupt itself, and to allow DMA access between ANTIC/GTIA and the main 6502.

PROGRAM TAKE-APART

Now let's wade through the program itself and see what it does. Listing 2 is the master file for FAX.M65, which is written in 6502 assembly language as implemented by Optimized Systems Software's MAC/65. Basically this listing refers to, or "includes," two files from the MAC/65 disk, SYSEQU.M65 and IOMAC.LIB. (These files are *not* contained on the Antic Monthly Disk.)

Finally, FAX.M65 includes Listing 3, FAXA.M65, which contains the major body of code. You don't need to type in Listing 2 or Listing 3, they are here to help you understand the logic and programming techniques used.

At the top of Listing 3 we have definitions for 9 macros. ADD.W will perform signed, two-byte addition. SUB.W will perform signed, two-byte subtraction. LEA.W will Load the Effective Address (a Word) into the named pointer. MOVE.B and MOVE.W will move a byte and a word, respectively, from one part of memory to another. WRITE will transfer a string of characters to a section of display RAM (such as the screen), performing ATASCII to screen POKE code conversion along the way. MOVEM will move values from multiple memory locations between different areas.

Constant Declarations occur between lines 800 and 1400. We reserve three different sections of memory between lines 1400 and 2350, including space for the text line and the display list. Starting at line 2380, we prepare the Atari to receive WEFAX.

BUILD.LIST dynamically builds a scrolling ANTIC Mode F (Graphics 8) display list. SCROLL is the routine which keeps track of the joystick and adjusts the display list accordingly. Notice that to scroll the screen, we don't move memory, we move pointers to memory. The INITFAXMAP routine will reset system variables to start-of-picture values, allowing you to receive a new WEFAX picture.

The area between lines 3890 and 4660 is where most of the work is done. Called from the timer interrupt, this section of code plots the dots on your screen. First, the program looks at the input port, joystick port 2. The incoming bit from the interface is wired to bit 7. If the bit is clear, the computer will branch-if-plus. Otherwise, we'll continue on to the LDA #0 and .BYTE GHOST instructions.

What does .BYTE GHOST do? Refer back to the Constant Declarations. GHOST has a value of $2C. In a book on 6502 programming, you'll find that instruction number $2C is the

continued on next page

BIT ABSOLUTE instruction, which is three bytes long. Let's examine how this changes the interpretation of the source code.

```
          BRANCH TAKEN

         PLT0
A9 01      LDA #1
...        EOR INVMASK...

      BRANCH NOT TAKEN
A9 00  D3  LDA PORTA
10 03      BPL PLT0

A9 00      LDA #0
2C A9  01  BIT $01A9
...        EOR INVMASK...
```

From this you can see that if the branch is not taken, the BIT instruction takes the LDA #01 instruction and uses it as the address to BIT from. Since we are not at all interested in the state of memory location $01A9, this test is meaningless to us, and we may ignore the results.

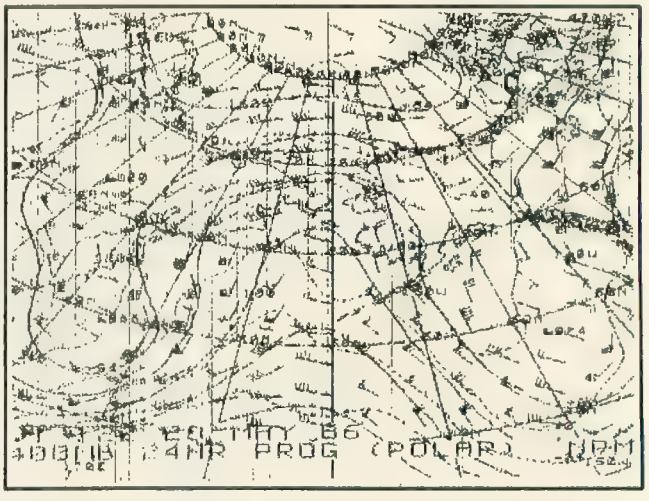
At this point, we have either a zero or a one in the accumulator. Again, we have a zero if the input bit is set, and a one if it is clear. Next, we exclusive-OR this number with INVMASK in case we pressed the [I] key and are running in Inverse video. Then we save the status register, go to the screen, find the bit that COLMASK is working on, and turn that bit off. This is because we assume the dot will be turned off. However, when we pull the status register we check for a value greater than zero. If a such a value is present, we fall through the branch to set (turn on) the appropriate dot. The computer turns on a dot by ORing in the bit value represented by COLMASK.

Next, around line 4110 we finish plotting the dot, and are ready to plot the next one. First, we check to see if ADJCOUNT has a value greater than zero, and if it does, we decrement it. We continue this until ADJCOUNT is equal to zero. This is where we "sync" by sliding the picture to the left.

Whenever you press the [A] key, the program places a small value into ADJCOUNT. This value is automatically decremented, as described above, until it reaches zero. Since we decrement a value instead of selecting the next available point to plot, the dead sector will creep to the left. However, when the value in ADJCOUNT is zero, it is time to select the next available dot.

PROCESS.POINT

Since our scan sweeps from left to right, the first thing we need to do is point at the next column to the right. Then, we compare the new column number with the total number of available columns to determine if we've finished plotting the current line. If so, we branch to PRO2, otherwise we select the next column by shifting the bits in COLMASK once to the right. If COLMASK is greater than zero, we branch to the next step in the program. When COLMASK is equal to zero, it's time for a new byte/column. So we reset COLMASK to $80 (the high bit is set), move the value from SPEEDADJ to ADJCOUNT, and then increase the pointer to the current screen byte (POINTER_C) by one.



A 400 millibar polar chart from NPM, Hawaii. The top curved line is the 80-degree latitude line, and the image extends to 40 degrees. Examine the center right portion of the image, you should be able to pick, out Alaska.

PRO2 AND PRO3

When the current horizontal line is finished, it may be time to advance to the next lower line. First we reset COLMASK to $80, move a byte from SPEEDADJ to ADJCOUNT, and then reset the CURRCOL counter to zero. Now, we determine if we have to skip lines onscreen. Pick up SKIPCOUNT. If it is a zero, we branch to PRO3. Otherwise, we are skipping lines onscreen, so point back to the start of the line we just drew and decrement SKIPCOUNT to count this line.

The PRO3 routine selects the next line to draw on the screen. First, we refresh the SKIPCOUNT from COLSKIP, add 1 to the current row counter, CURRROW, and increase our STARTADR pointer (which points to the start of each line onscreen) by the number of bytes per line, BPL. Next, we refresh our working pointer, POINTER_C, from STARTADR. Next, we compare CURRROW to NUMROW to see if we have reached the total number of rows allowed. If CURRROW is less than NUMROW, we haven't finished yet, so return. Otherwise, our picture is finished, so set STATUS to PIXOVER. This tells the interrupt routine that we're finished.

The next two routines, START.TIMER and STOP.TIMER are fairly straightforward. START.TIMER sets up a sixteen-bit counter from AUDF1 and AUDF2, sets the timer values from TIMERCOUNT, and enables the interrupts. STOP.TIMER sets STATUS to PIXOVER and disables the timer interrupt.

The following routine, PLOTDATA, is the routine which services the timer interrupt. As we enter the routine, our accumulator has already been saved on the stack, so we push the X and Y registers onto the stack and check STATUS. If STATUS is equal to either zero or PIXOVER, we branch out of this routine. However, if STATUS is not equal to PIXSTART, it must be equal to PIXDRAW, so we branch over JSR

INITFAXMAP, since this routine is only performed when STATUS is equal to PIXSTART. Then we execute the GETPOINT subroutine described earlier. When we're finished, we leave the interrupt.

The next three subroutines dump the satellite picture to a dot-matrix printer. The PRINTBYTE routine just sends a single byte to the printer. The PRINTFAXMAP routine opens a channel to the printer, configures it for graphics, and then one byte at a time will PRINTALINE until all of the columns are finished.

INIT.SCREEN sets the default values for initializing and coloring the screen. We turn ANTIC off, clear the screen RAM and reset HORIZ.COUNT and VERT.COUNT to zero. Next point to the DISPLAY screen, build our display list and place it where the OS can find it. Finally, we adjust the screen colors and turn ANTIC back on.

DECIMALIZE will convert a binary value in memory locations DECIMAL and DECIMAL+1 to a four-digit ATASCII number in locations DECIMAL, +1, +2, +3. DEC.TO.ASCII is called from this routine.

Below the decimal conversions, UPDATE.STATS converts three system variables (COLSKIP, NUMCOL and TIMERCOUNT) to ATASCII and places the answers in scratch RAM. Finally, a routine in the WRITE macro will display this information on the screen, performing ATASCII to screen POKE conversions as needed.

The next routines are related: KEYBUFF is a small buffer we use to store keystrokes. KEYTABLE is a table of all the keystroke commands the program recognizes, with LENKEYTABLE keeping track of how many entries there are. KEYJUMPTABLE is a list of subroutines to perform, listed in the *same order* as the KEYTABLE entries.

MAIN LOGIC

MAIN is the start of program logic. We first INIT.SCREEN, getting it ready to receive pictures, then we complete the job by calling UPDATE.STATS, which shows the statistics along the bottom of the screen. Next, we OPEN a channel to the keyboard and set STATUS to PIXOVER. We start the loop called MAIN1 and try to scroll around the screen, if desired.

Now, we check to see if someone has pressed a key lately. When a key is pressed, the OS deposits the key's hardware value into memory location CH (746, $02FC). We can detect this by checking for a value other than $FF. When one is found, we fall down to the line where we BGET a single character from the KEYBOARD and place it into KEYBUFF.

Next, we check the character against every entry in the KEYTABLE. If there is no match, the character was not recognized, and the computer loops back to MAIN1. Otherwise, the value in the X register will be equal to the number of the desired routine, as listed in KEYJUMPTABLE.

To call a routine from its KEYJUMPTABLE number, we need to double the number in the X register, permitting us to use it as an index into the table of .WORDs which make up KEYJUMPTABLE. Next, we return this number to the X register, pick up the high and low bytes of the desired address from KEYJUMPTABLE and push them onto the stack. Finally, we perform an RTS. Since we just pushed our own "return" address onto the stack, the 6502 will pull those two bytes off the stack and use them to return to. However, in this case we're returning to someplace we've never been.

SAVING AND LOADING

Our last two routines are SAVE.PIX and LOAD.PIX. SAVE.PIX will let you save either a FULL or MICRO screen. When you save a FULL picture, the entire 30K+ scrolling screen is written to disk. Because of the size, you can ony fit two FULL pictures on a disk. Thus, you may only save FULL pictures named D:WEFAX.1 and D:WEFAX.2.

The MICRO option only saves the parts of the picture that are visible on the screen. It creates a 62-sector Micro-Painter compatible file called D:PICTURE.

LOAD.PIX will only load FULL pictures. The program will ask you whether you want to load picture 1 or 2. Any other choice drops you out.

Listing on page 73

ATARI PLANETARIUM

Atari Corp.
1196 Borregas Avenue
Sunnyvale, CA 94086
(408) 745-2000
$24.95, XL/XE and disk

Reviewed by Gregg Pearlman

Atari Planetarium puts the galaxy on your monitor. You can recreate past celestial events, or plot future

Max Seabaugh

ones. Set it for any hour and date between 9999 B.C. and A.D. 9999, and the Planetarium will show where the heavenly bodies were or will be then. The program even accounts for the change from the Julian calendar to the Gregorian in 1582, when 10 days in October magically disappeared to accomodate the new way of reckoning.

The Planetarium plots the movement of these bodies with a time clock that can go backward or forward at up to 64 times faster than real time. If you move the cross-hair cursor off the screen, the picture scrolls in that direction. You can even make printouts, but unfortunately the cursor appears on them.

The Earth is "transparent," so that celestial objects are visible through the planet. For example, if the computer's vantage point is set at San Francisco in the late morning, you can still see the moon on the screen.

SKY is the normal display mode. MAP lets you select a location on Earth from which to view the heavens. SET selects the time and date. CHART, used chiefly for printouts, allows you to view sections of the celestial sphere without obstruction by the horizon, and with north always directed upwards for easy orientation.

Planetarium is also full of interesting options. LINES draws line diagrams between stars to help define constellations. NAMES displays three-letter abbreviations next to constellations. SYMBOLS marks planets with their respective astronomical symbols. DEEP SKY displays very distant galaxies. TRACK records the orbits of two celestial objects, such as a planet and a moon, to determine their closest approach. SOUND turns the cursor into a space shuttle, complete with noise.

The 115-page instruction booklet contains latitude and longitude tables for almost 200 locations on the Earth, lists of stars and constellations, a few future astronomical events and mathematical conversions. An example in the manual shows Halley's comet over Wollongong, New South Wales, Australia, on April 5, 1986.

If you know the date of a solar eclipse, just enter that date, plus the time and location from which it was seen, and it will be reproduced on the screen. Other events covered include planetary transits (where Mercury or Venus lines up between the Earth and the sun), planetary occultations (eclipses of a planet by another planet, or by the moon) and planetary alignments.

Planetarium, though fun, has a somewhat limited appeal. It is probably most useful for amateur astronomers. Its best feature is making printouts which will help users find heavenly bodies with telescopes.

When making printouts, the printer's dip switches must be adjusted manually to disengage the automatic line feed. And don't forget to turn the automatic line feed back on after using Planetarium.

Setting the longitude and latitude of your location is tricky. On the program's world map, San Francisco's coordinates appear to be in Washington. Therefore, if your coordinates are not listed in the manual, consult an almanac. Don't guess, because you'll be way off.

However, Atari Planetarium is informative and has interesting graphics. You might learn a lot from it while you're enjoying yourself.

MICROFLYTE ATC JOYSTICK

MicroCube Corporation
PO Box 488
Leesburg, VA 22075
(703) 777-7157
Requires SubLogic Flight Simulator II
$59.95

Reviewed by Charles Jackson

SubLogic's popular **Flight Simulator II** program is the most powerful flight simulator available for 8-bit Atari computers. With a few keystrokes, you can adjust the plane's flight controls, engine controls, radio controls, even the view you see from the window.

Take control of Flight Simulator II with this analog Joystick

This is also the simulator's weakness—real airplanes are not keyboard-controlled. Proficient pilots who aren't proficient touch-typists quickly become disenchanted with using the R, Y, V, N, C, M, / and arrow keys to control the elevator and ailerons trim, flaps, throttle and rudder.

But now for the price of renting and flying a real airplane for an hour, you can purchase the **MicroFlyte**

ATC Joystick and take control of Flight Simulator II with a minimum of keystrokes. Special throttle and flap buttons are mounted on this self-centering *analog* joystick. A standard joystick uses internal ON/OFF switches to recognize eight directions (forward, back, left, right and combinations of these). An analog joystick uses two potentiometers (similar to volume controls) to recognize the direction as well as the magnitude of the turn. Simply put, the MicroFlyte joystick helps you "fine tune" your flying.

The joystick's shaft, a metal rod about two inches long, is mounted in a metal box about half the size of a telephone. The package includes a joystick driver program which lets Flight Simulator II use the MicroFlyte joystick instead of a standard one.

Currently, the MicroFlyte joystick will *only* work with SubLogic's Flight Simulator II program. A joystick driver for MicroProse's **F-15 Strike Eagle** will be available soon, according to MicroCube.

MICROLEAGUE BASEBALL

MicroLeague Sports Assoc.
2201 Drummond Plaza
Newark, DE 19711
(302) 368-9990
(800) PLAYBAL
$39.95, 48K disk

Reviewed by Gregg Pearlman

Nothing frustrates a baseball fan more than the time between the World Series and spring training. But with **MicroLeague Baseball**, you can have a baseball fix in the dead of night or the dead of winter, and you don't even need videotapes.

MicroLeague has fine graphics and easy-to-understand rules. The players move pretty freely and do "baseball things" like throwing the ball around the horn after a strikeout or gathering at the mound when the manager comes out.

The disk has statistics, rosters and characteristics for 25 teams (mostly world champions). A solo player can go up against the "Baseball Buddha" computer manager, or two human fans can compete against each other.

I managed the 1973 Oakland A's in four games, winning twice. The most exciting game went 14 innings against the 1980 Philadelphia Phillies. The

Max Seabaugh

lead changed hands three times before the A's tied it in the eighth.

After Manny Trillo and Greg Luzinski had powdered Ken Holtzman's pitching for a 3-1 Philadelphia lead, the A's outlook was dim. But Gene Tenace homered to right-center off Steve Carlton and Ray Fosse's two-run single put the A's up 4-3.

The Phils regained the lead when A's reliever Horacio Pina balked a home run and Mike Schmidt singled. Oakland scored when the usually sure-handed Trillo booted Tenace's grounder. Tenace went to third on Billy North's hit-and-run single and scored on pinch-hitter Vic Davalillo's infield out. With one out in the 14th, Tenace homered yet again to right-center. The A's led 6-5.

Unfortunately, in bottom of the 14th with two outs and men on first and second, the Baseball Buddha chose to let Phillie reliever Kevin Saucier hit for himself. The game was history, and the A's, I imagine, leapt all over each other in delight.

It bothered me to see such an exciting simulation sullied by such an obvious glitch. MicroLeague Baseball is not as realistic as it should be. Slow runners stole bases and the faster runners were washouts. Pitchers drew nine walks in four games, more than any other players. Pull hitters didn't pull the ball. Only the outstanding fielders made errors. Murderers' Row—those Yankee sluggers of old—managed only one home run, by Tony Lazerri.

But why quibble about minor inaccuracies when you want to have fun? Without question, this is a good simulation for those who really love baseball. If you want more realism, visit the ballpark.

STAR RAIDERS II

Atari Corp.
1196 Borregas Avenue
Sunnyvale, CA 94086
(408) 745-2000
$19.95, 48K disk

Reviewed by Gregg Pearlman

Star Raiders II stacks up well against its predecessor, the classic cartridge game that was one of the best reasons for buying the early (and expensive) Atari computers. However, the two Star Raiders look entirely different and the main similarity between them is the title.

Welcome to "High Noon in Space." It's you and your trusty ship, the Liberty Star, against thousands of baddies in the struggle against the Zylon Empire. Star Raiders II will hold your attention for hours. Its excellent sound and graphics create a fascinating space-battle simulation, and every time you turn around there's another Zylon squadron to decimate.

The 12-page instruction book contains all the information you need. The Liberty Star is equipped with

continued on next page

Pulse Laser Cannons for the Zylon Fly Fighters, an Ion Cannon for the enemy Destroyers and Command Ships, and Surface Star Bursts (SSBs) for the Zylon attack bases in the Procyon Star System.

However, you should first clean up the local Celos IV system, and you'll initially face the Fly Fighters. After picking them off, your task is to destroy the Destroyers before their macrowaves destroy allied cities. Sometimes Zylon Command Ships pop into the area, and the best move is to fire once or twice and warp out quickly—those ships are the most

serious threat you'll face, so strike the first blow.

Once your little corner of the Universe is decontaminated, warp to the Procyon system to pillage the attack bases on the planets. Blowing up the bases prevents the Zylons from making more ships to terrorize the Celos IV system.

There are the two simple rules to follow if you want to stay alive. Don't ignore your message window, and respond promptly to the danger messages. The message window indicates the status of your ship. When it announces that your energy level is critical, warp to a starbase and fuel up. If your shields, weapons, or communications devices are damaged, go to the starbase for repairs. It's not hard to stay alive if you follow the advice of the message window, but there is a constant need for fuel and repairs, especially in the midst of battle.

Continually having to blow away the same ships can become monotonous. The Fly Fighters are indeed like flies, easy to kill and more annoying than dangerous. They often hover just outside your range of fire. But although they can run, they can't hide. You won't see Destroyers until all present Fly Fighters are eliminated.

The Destroyers are more like horseflies. They are also fairly easy to destroy—although you'll need to hit them two, three or even four times. But they can bite you if you're careless. Sometimes they obstinately refuse to be hit, and you'll have to "steer" your cannon blasts at the erratically moving ships. Unless the Destroyers have lowered their shields while macrowaving a city it is useless to fire directly at them.

As you'd imagine, it's easy to rack up points. Each Fly Fighter is worth 100, and each Destroyer 500. Squadrons usually comprise about 3,000 to 5,000 points worth of ships. So if points are all you crave, you can just ravage the squadrons and pick up 200,000 points in a couple of hours.

However, the goal of the game is to save the allied cities in your sector. Only after you've cleaned that up should you go to Procyon and destroy bases. But Procyon is no picnic because of that constant need for fuel and repairs. By the time you've warped back to a starbase in the Celos IV system to refuel, the Zylons could easily could have sent more squadrons your way, further delaying your return to Procyon.

The Zylon attack bases are difficult to destroy. It's not that they fire back, or because of the Fly Fighters. But while the planet rotates, you keep orbiting in the opposite direction. The Liberty Star can't shift into reverse or synchronize in an orbit with the planets, so there is time for only one shot at one attack base before you must move on to the next.

Star Raiders II is enjoyable and challenging enough to keep you involved for several hours. Saving planets is no day at the beach, but it's not so difficult that you won't have a chance. Just follow the rules, keep an eye on the message window and fire away.

COMPUTE YOUR ROOTS

Wasatch Genealogical Software
2899 West 7550 South
West Jordan, UT 84084
(801) 483-3357
Requires BASIC
$39.95, 48K disk

No program can trace your family heritage back to your original ancestor, but **Compute Your Roots** can take genealogical information from you, store it on disk and print it neatly in standard diagram formats called pedigree charts and family group sheets.

This menu-driven package by Jerry Halls, a Utah 16-year-old, also includes a simple word processor for entering

Max Seabough

interesting details about family members. The word processor features a global search routine that can find any name, date, or any other information in your data files.

Along with the program disk, the package contains a 12-page instruction manual and a sample pedigree chart and group sheet in 10-inch and extra-wide 15-inch carriage formats. A printer that can produce condensed typeface (17 characters per inch) is required.

BASIC TRACER

Powerful debugging utility

by KEVIN GEVATOSKY

BASIC Tracer is a powerful debugging tool that displays onscreen the line number being executed by your program. This BASIC program requires an Atari XL or XE model with at least 32K memory and a disk drive.

If you write long BASIC programs, you've probably spent long hours trying to figure out what made a GOTO or GOSUB go somewhere it shouldn't.

Finding the bug usually requires inserting STOPs, TRAPs, PRINT statements, etc. at various points in the program and then RUNning it so you can observe the results. Repeating this "insert and RUN" method enough times should eventually isolate the problem. However, there is now an easier, more direct way to trace the workings of your Atari BASIC program.

BASIC Tracer is a debugging utility for Atari XL and XE computers. It tracks and displays the current line number that your own BASIC program is pointing to. It also gives you the option of slowing down the execution speed, so that you can see when and where your program is branching. When you find a glitch in your own program's flow, just press the [BREAK] key and execution will stop at the displayed line number so you can solve the problem.

GETTING STARTED

BASIC Tracer is written in MAC/65 assembly language, but it's adapted to a "BASIC loader" version that will be easier for you to type. Listing 2, TRACER.M65, is the assembly language source code—it is provided just for your information and you don't need to type it.

Type in Listing 1, TRACER.BAS, check it with TYPO II and SAVE a copy before you RUN it. When RUN, the program will write a "load and go" binary file called TRACER.EXE to the disk. Copy this file to another disk and name it AUTORUN.SYS.

USING TRACER

When TRACER.EXE is activated, a blank Graphics 0 text line appears across the top of the screen and you'll see the READY prompt. Type [? A] and you'll see the line number 32768—which BASIC assigns to a statement that has been entered without a line number. Now load or type in a short Atari BASIC program and watch the line number change as the program executes.

If you POKE 207,20 and RUN the program again, you'll notice the line number changing much more slowly. This is because location 207 now contains the delay value used to control BASIC's execution speed, and can be POKEd with any number between 1 and 255. The larger the number POKEd, the slower BASIC will execute. To restore execution speed to normal, POKE 207 with a zero.

Also, holding down [CONTROL] while pressing [ESCAPE] will temporarily bypass the execution delay, and BASIC will proceed at the normal (zero) rate until the [ESCAPE] key is released. This feature is handy for quickly getting through portions of a program that you are not interested in tracing. Finally, program execution can be halted and resumed again by toggling the [CONTROL] [1] key sequence.

HOW IT WORKS

Atari BASIC, unfortunately, does not provide any RAM vectors to its execution control code located in ROM. Thus there is no way to monitor the line number being executed. How-

continued on next page

ever, BASIC Tracer overcomes this by copying the BASIC ROM code to lower RAM and then switching off the ROM.

The code is then moved back up to high RAM, starting at address $A000, and a vector is installed at address $A978. This vector points to code on Page 6 which reads the current value of STMCUR ($8A) and displays the value on the text line at the top of the screen.

Control is returned to BASIC via a JMP to STGO (STatement GO) at location $A97E. The 76-byte routine that sets up the RAM-BASIC and installs a vector is only used once—to initialize BASIC Tracer. Since I needed the space on Page 6, I put this routine on the system stack at address $100.

To display the additional text line, I changed the ANTIC instruction for displaying eight blank lines ($70) to the instruction for displaying a Graphics 0 mode line ($42). Of course, the 40 bytes of screen data required to display the mode line had to be located in memory somewhere outside Page 6 that would not be disturbed by BASIC. For this purpose, I chose the cassette buffer at address $400.

This method is compatible with any BASIC program that does not alter the first three instructions of the display list. Whenever BASIC JuMPs through the vector at $A978, BASIC Tracer checks to see if the changes in the display list are still active. If not, a JSR is made to the routine which alters the display list so that the line number will continue to be displayed even with a change in graphics mode.

MORE HINTS

1. Pressing [RESET] re-initializes the BASIC ROM and disables BASIC Tracer.

2. Any BASIC statement which alters Page 6 (or decimal locations 20,207,208 or 209), such as a POKE or USR(1536), must be REMmed out before you attempt to trace the program.

3. Be sure to SAVE any BASIC program in memory before accessing DOS, or the program won't be where you left it when you return.

4. After going to DOS, you can return to the RAM-BASIC by using the RUN AT ADDRESS option (DOS menu choice M) and typing A000.

5. If the Graphics 0 mode line should vanish from the top of the screen, don't panic. It will reappear when BASIC executes the next program statement.

6. In GTIA Graphics 9, 10 and 11, the displayed line number is unreadable.

7. If you load a BASIC program from cassette, then you will have to enter a Graphics 0 command and a [?] to clear the garbage off the line number display.

Kevin Gevatosky of Eugene, Oregon is the Atari consultant and programmer for Covox Inc., makers of the Voice Master speech system, and a freelance writer-programmer.

WHERE THE WEATHER COMES FROM

On the roof: Dish antenna downlinks satellite photographs.

by Gigi Bisson, **Antic** Assistant Editor

Inside a National Weather Service station

Almost suburbia: The Weather Service Forecasting Office.

It looks like a suburban house—until you see the 24-foot satellite dish antenna on the roof. This is the National Weather Service Forecasting Office, just off the freeway in Redwood City, California. Inside this unassuming building, an astonishing array of computers and electronic equipment helps meteorologists make weather forecasts for the Western United States, local TV stations and ships at sea.

"Everything the TV stations and newspapers get, they get from us," say weather service electronics technicians Bill Pettyplace, Dave Lindholm and Bob Levno. During a tour of the weather station, they gave us a glimpse of the side of meteorology that the public never sees.

The walls of the weather station are lined with maps—topographic maps, oceanic maps, local maps, world maps. A bumpersticker affixed to a door proclaims: "The ocean is a liquid asset." Computers are everywhere. The office literally hums with activity from banks of machines.

"And this," explains Pettyplace as we stand surrounded by blinking lights, printers, plotters and monitors, "is only the tip of a very large ice-

Photography by Eric Weber

First stop: Technician Dave Lindholm explains how computers process satellite data.

"Massaging" data: Bob Levno checks a weather facsimile map as it comes out of the plotter.

berg." There are 280 Weather Service stations in the U.S., each loaded with an identical array of electronic paraphernalia. Only a handful, however, relay weather facsimile (WEFAX) satellite maps and photos.

Our tour starts where the "product"—weather information—ends. Just beyond the lobby, weather forecasters answer constantly ringing phones, peer over maps and distribute information to the news media and the public. But it all starts in that big dish on the roof.

MASSAGING THE MAPS

Those satellite photos in newspapers and on TV might mislead you into believing the earth already has a map deeply etched into its surface. Cloud patterns often obscure the earth's land masses. So before we see them, satellite photographs are "massaged," as Levno puts it in technician's jargon. In other words, the computer draws a grid of longitude and latitude and a political map indicating state and national boundaries aligned precisely with the land masses on the photograph.

We visit yet another room of teleprinters, mainframe computers, IBM PC XT microcomputers, and huge, dual Data General Eclipse computers assembled especially for the weather service by Ford Aerospace. The photograph is recorded, divided up into four sectors, each quadrant small enough to fit on the plotter, and recorded again on computer tape drives. Another plotter creates contour maps of the jet stream and wind patterns.

The images are then printed on wet, chemically-treated thermal paper. The paper printouts are saved for archival purposes for a period of 90 days. The technicians check the image on these large violet-colored printouts to "make sure we're sending out a good product" Pettyplace says, before converting them back to a digital form that can be stored on computer tape.

Pettyplace showed us an Alden Marine Fax plotter, the $2,000 plotter that ships use to decipher the maps.

"It essentially does what you'll be doing when you try to receive the satellite photos on your Atari computer screen," he says.

The information is stored on tape and an entire day's worth of satellite pictures are sent at once. The computer transmits the signal over telephone lines to a transmitter at the Coast Guard station in Point Reyes, a coastal town 75 miles north of Redwood City. WEFAX maps from this station are identified by the letters NMC across the top.

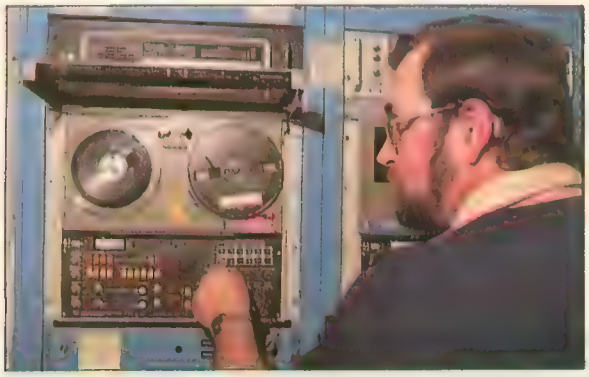
FINALLY, A FORECAST

And yet another room full of equipment, where meteorologists buzz around interpreting the satellite photos and making forecasts. Clouds swirl around the earth on huge video monitors. Pettyplace demonstrates weather service photos on a screen controlled with a trackball. He flips the ball, and zooms in again and again for a closer view of a coastline.

Twenty-four hours worth of these photos are spliced together into a video "loop," forming a 10-second show of clouds and atmospheric activity swirling around Earth. We watch a loop taken during the full moon. Pettyplace points out the moon's light reflecting off the Pacific Ocean at night.

IBM microcomputers monitor the stations, deciphering hydrologic data, wind speed, air pressure and temperature. This information is then sent to repeaters. In yet another room, meteorologists record weather news reports to be broadcast over the local shortwave weather band.

Weather band: Bill Pettyplace stands in the radio studio.



Ready to broadcast: Satellite photo data is translated into audio tones.

Rain or shine: Alerting the news media, military and public.

WEATHER CALCULATOR

Meteorologist uses Atari as home forecasting tool

Article by GIGI BISSON, Program by E. JAN NULL

Make weather predictions with the same program a professional meteorologist uses to calculate weather readings at home on his Atari 800. With Weather Calculator and your outdoor thermometer, you can convert Celsius temperature readings to Fahrenheit, find the relative humidity, estimated cloud base, wind chill factor, and predict sunrise and sunset times for any given date. The BASIC program works on all 8-bit Atari computers of any memory size, with disk or cassette.

Jan Null is the weatherman behind the weathermen. Before the daily forecast reaches the television evening news, Null, along with a team of meteorologists, writes the warnings and forecasts that all of Northern and Central California depend on.

As a lead forecaster at the National Weather Service office in Redwood City, California, Null coordinates the satellite photos and weather band radio broadcasts used by pilots and ships at sea. In times of disaster, he works with state and local agencies, the Coast Guard and National Guard to prepare for major storms, floods, tornados and tsunamis.

Six years ago he found a new forecasting tool to add to the National Weather Service's cache of sophisticated instruments, satellite dish antennas, and mainframe computers—an Atari 800 computer. At home with his Atari, a modem and a terminal emulation program, Null logs onto the weather service's huge Data General computers. He can keep up on the latest weather changes—and find out if the predictions he made earlier at work are accurate. He also does weather research on the CompuServe Information Service. (Just type GO WEA at any ! prompt to use that weather database.)

Null also uses his Atari to make computer printouts of the temperature conversion tables that he uses for calculating weather conditions. Eventually, those tables grew into Weather Calc—a very simple, menu-driven program.

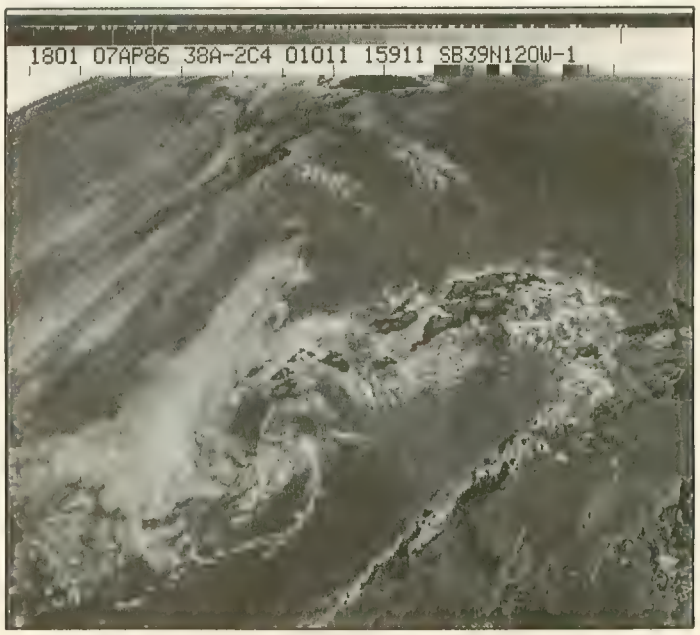
USING THE PROGRAM

To use this program, type in Listing 1, WX.BAS, check it with TYPO II and SAVE a copy before you RUN it.

TEMPERATURE CONVERSION

Weather Calc's temperature converter translates Celsius temperature read-

continued on next page



No satellite photos required. All you need to predict weather is Weather Calc and a thermometer.

ings into Fahrenheit or Kelvin measurements and back again. Simply type in the temperature reading. The program does the calculations.

DEW POINT
HUMIDITY
ESTIMATED CLOUD BASE

The dew point is the temperature to which the air must be cooled in order to convert water vapor into liquid. For example, when beads of water form on the outside of an ice-filled glass, or water vapor turns into rain. To determine this, type in the dry bulb temperature (a reading taken with a regular thermometer) and then enter the wet bulb temperature (a reading taken with a sling psychrometer).

If you don't have a sling psychrometer, Null suggests simply wrapping a small piece of wet gauze around the bulb of the same thermometer used for the dry bulb reading. Carefully swish the thermometer back and forth in the air a few times to get the air circulating through the gauze. This reading should be lower—reflecting the cooling effect of the evaporation caused by the wet cloth. Using the two readings, the program calculates the dew point, humidity, and estimated cloud base.

What is the cloud base? A certain temperature and dew point exist on ground surface under normal conditions. As you go higher in the atmosphere, the air temperature cools faster than the dew point temperature. Condensation and clouds form when both readings reach the same point. So the closer the temperature and dew point readings are, the lower the cloud cover will be—if they're within five degrees, expect fog.

WIND CHILL FACTOR

The temperature may be 50 degrees, but if the wind is blowing at 20 miles per hour, the chilling effect on exposed skin will feel like 30 degrees—much colder than the air temperature suggests. That's the wind chill factor at work. To calculate this, enter the air temperature and wind speed. (To find the wind speed, call your nearest National Weather Service office, or tune into the weather band on a shortwave radio with police band or, use the weather maps from your WEFAX programs..)

SUNRISE/SUNSET

Find out what time the sun will rise and set on any day in any year. Enter the latitude and longitude in degrees and minutes (for example: Latitude: 35, 27; Longitude: 135, 5) and then the date. For July 28, 1987, you'd enter 07,28,1987.

The program will calculate an estimated time of sunrise and sunset, accurate within a minute or two. Add one hour if the date is during daylight savings time. The actual time the sun rises or sets in a particular location may also depend on the surrounding terrain—mountains, hills and such. To find the latitude and longitude, consult a map or almanac, check the public library, ask a science teacher or call the nearest National Weather Service office.

The basic formulas for the meteorological calculations in this program are from the *Smithsonian Meteorological Tables.* Those for the sunrise and sunset data are from *Almanac for Computers, US Naval Observatory.*

Xlent Software's PRINTWARE SERIES

TYPESETTER
BY DORFMAN & YOUNG

UNSURPASSED PRINT QUALITY

- Over 700,000 pixels resolution
- Create any printed material-labels, cards, newsletters, business graphics
- Use pictures from other programs
- Create clip-art and "stamp" anywhere
- INCLUDES 17 FONTS!

ST VERSION: $39.95

ALL 8-BIT: $34.95

RUBBER STAMP
BY YOUNG, DORFMAN, AND DELLINGER

HI RESOLUTION UTILITY

- Create up to FOUR icons AT ONCE
- Modify Gr.8 or 7+ screens & add text in 32 sizes and TWO resolutions
- Business/personal graphics for display, or use in TYPESETTER

ST VERSION: $39.95

ALL 8-BIT: $29.95

PAGE DESIGNER
BY YOUNG & DORFMAN

FULL PAGE TEXT & PICS

- Easily creates full-page layouts GRAPHICS & TEXT
- Use layouts in TYPESETTER (GREAT for two-column work for newsletters!)
- 80-column typestyle included
- Use pix and fonts from other ware

ALL 8-BIT: $ 29.95

MEGAFONT II+
BY DELLINGER & ROGNLIE

TEXT-ICON-PIC PRINTWARE

- Revised to use any 8x8 fonts & to print PRINTWARE icons
- Print program lists, or text files from most Atari DOS-type word processors, IN ANY TYPESTYLE!!
- Print pics & icons in up to FOUR SIZES!
- FAST PRINT OPTION

ST VERSION: $39.95

ALL 8-BIT: $24.95

THE PRINTWARE SERIES WORKS WITH:
EPSON-PANASONIC-GEMINI-PROWRITER-SG10-LEGEND
AND ALL COMPATIBLE PRINTERS

P R E S E N T S

TECHNICAL SPECIFICATIONS:

- THE SCREEN EDITOR/FORMS GENERATOR:
  - 32 screen pages per logical record
  - All regular screen attributes and colors supported
  - The same editor used for all editing functions including documentation
  - All screens compressed to save disk space
  - Automatic box generation to aid in screen design
  - Chained screen dumps to printer supported
  - On-line help for all editor functions
- THE MANAGER PROGRAMMING LANGUAGE:
  - Five function calculations supported (+,–,*,/,↑exponentiation)
  - Both numeric and string arrays supported
  - System variables such as time and date supported
  - If..then..else..endif
  - While..do..endwhile
  - Fully recursive expression evaluator
  - Complete error and syntax checking by The Manager
  - Booleans, wild-cards, and complex string handling

  - Multi-file operations
  - Edit checking and user interaction at the field level
  - Unlimited lookups
  - Passwords by activity at the field level
  - Audit trails to other Manager file systems
  - Multi-file decisions based on computed data
  - File summaries to be sent to other files
  - Recursive file managing as in bill of materials explosions
  - Multiple program modules as a result of requested activity
- THE RECORD EDITOR:
  - Allows fast data entry with field by field editing
  - Allows automatic field and record recall to eliminate retyping
  - Allows data field type checking and management
  - Allows editing of existing records singly or in groups
  - Allows complex searching strategies with full query system
  - Allows full file update functions with a single keystroke
  - Allows unlimited real time calculations on field data
  - Allows multiple file maintenance from one logical record
  - Allows single step multiple record deletions (password controlled)
  - Allows full audit trails to be created and maintained
  - Allows on-line context sensitive help linked to the field level
- SORTS:
  - Allows selective sorts on any set of complex search criteria
  - Allows any number of sort keys
  - Allows both numeric and alphabetical sorts
  - Allows any key to be ascending or descending
  - All conditions are entered on the record screen for simplicity
  - Pointer file is standard ASCII for other systems
  - One of the fastest sorts we've ever seen
- INTERACTION WITH OTHER DATA SYSTEMS:
  - Allows input and output of "DIF" files (for Lotus™ etc.)
  - Allows straight ASCII files for word processors and programs
  - Allows information to be extracted from any Manager files
  - Allows database reconstruction
- INDEXING:
  - Allows any field or fields to be indexed for fast retrieval
  - Allows addition or change of the index fields at any time
- CONTROLLABLE CONFIGURATION:
  - Allows various activities to be assigned to specific drives or directories
  - Allows use of ram disk for temporary sort files
  - Allows multiple editing screens for one file system
  - Allows performance optimization in multi-user systems
- REPORT PARAMETERS:
  - Allows direction of report to any device (screen, printer, disk, com port)
  - Allows multiple copies of the report to be specified
  - Allows sorts to be specified for a given report
  - Allows for automatic totalling of columns
  - Allows continuous or single form feed
  - Allows printer commands to be used for special report features
  - Allows special programs to be executed on the report
- REPORT FORMATTING:
  - Allows full screen editing of report formats
  - Allows unlimited sub-totalling
  - Allows any level of computation on one or more logical records
  - Allows labels of varying width
  - Allows specialized reporting of sub-totals and totals
  - Allows full page as well as columnar reporting
  - Allows form letters which include record data
  - Allows both detailed and summary only reports with a single key stroke
  - Allows any subset of records to be reported

"NO PRACTICAL LIMITS ON FIELD NUMBER, FIELD SIZE, RECORD SIZE, OR NUMBER OF RECORDS."

Available for: $169.00 US – Atari version; $695.00 US – IBM version.
Phone (416) 876-4741 or send cheque or credit card number to:

WEATHER MAPS FROM SPACE

by PATRICK BASS, **Antic** ST Program Editor

ST WEFAX DECODER

Degas graphics from satellite pictures

With the ST version of WEFAX Decoder you can reconstruct weather satellite pictures on your Atari ST and convert them to DEGAS graphics files.

In this article, we deal exclusively with the operating instructions and special features of WEFAX Decoder for the ST. For additional information on the overall program structure and details about the international Weather Facsimile system, see the related stories in this issue. Also, please note that this program *won't* work unless you use it with the WEFAX Interface hardware described elsewhere in this issue.

ST WEFAX Decoder is written in MC68000 assembly language as implemented with AS68.PRG. This is the assembler included with the Atari ST Developer's Kit. However, the program should work fine with any 68000 assembler using standard Motorola mnemonics—such as the Metacomco Macro Assembler or the assembler provided with Haba Hippo C.

This program is substantially different from **Antic's** other programs for the Atari ST. For example, ST WEFAX Decoder makes no calls to GEM and doesn't even recognize that GEM exists. The closest we get are a few calls to Atari XBIOS and use of the Line-A interface to plot points on screen.

TYPING IT IN

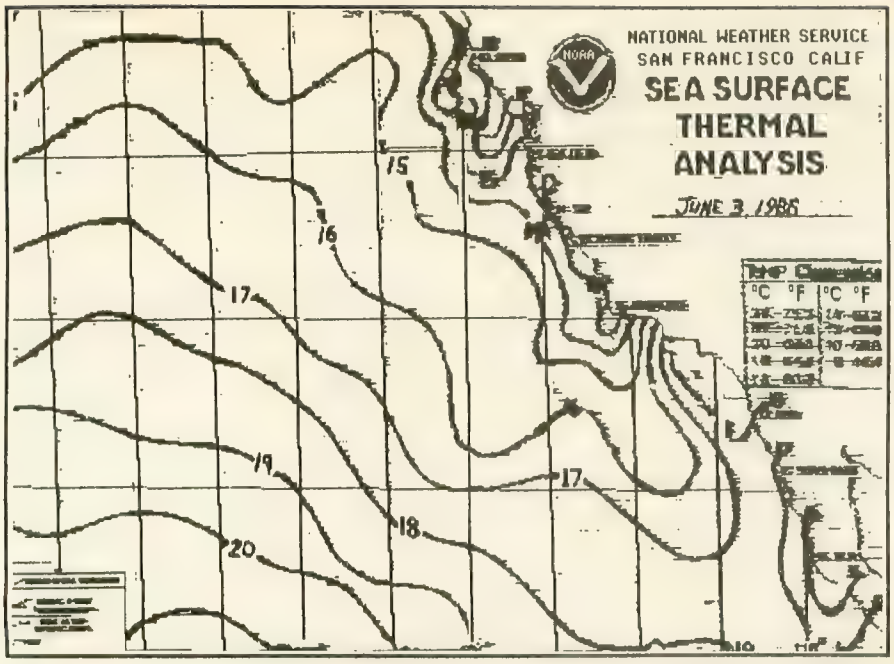
Using your favorite text editor or word processor, *carefully* type in the listing, STFAX.S, and save a copy to disk.

(Antic Disk subscribers can skip to the Program Operation section of this article. STFAX.S is on Side B of the monthly disk—along with the STFAX.TOS listing explained later. Follow the ST Help file instructions for transferring the programs to an ST 3.5-inch disk.)

After you type in the listing and save a copy, assemble it into an executable program. Although other assemblers may operate differently, the method I used for assembling with AS68 is as follows. First, you will need a disk with these 10 programs on it:

1.	AS68	PRG
2.	AS68SYMB	.DAT
3.	BATCH	.TTP
4.	LINK68	.PRG
5.	OSBIND	.O
6.	RELMOD	.O
7.	RM	.PRG
8.	WAIT	.PRG
9.	ASM	.BAT
10.	STFAX	.S

The top eight programs are obtained from the Atari ST Developer's Kit, and you have already typed in



A typical enhanced WEFAX chart received with the ST WEFAX program.

number 10, STFAX.S. But what about ASM.BAT, number 9?

You'll need to create your own ASM.BAT batch file, but it's quite short. This file consists of the following lines of code:

```
as68 -l -u %1.s
link68 [u,s] %1.68k = %1,osbind
rm %1.o
relmod %1.68k %1.tos
rm %1.68k
wait
```

NOTE that the -l in the first line is a lower-case letter l—all other similar-looking characters are number ones.

When finished, save the above file to disk as ASM.BAT. This is the file which will instruct the BATCH program how to assemble and link the STFAX.S program together.

With all the needed files on one disk, preferably a RAMdisk, double-click on BATCH.TTP, and in the resulting dialog box type in ASM STFAX *without* the .s extender. AS68 will assemble and LINK68 will link your resulting .o file together with OSBIND.O to create a finished TOS program. When finished, you'll find STFAX.TOS on your desktop. This is your WEFAX program.

Sports Wirephoto received with the 8-bit WEFAX program.

PROGRAM OPERATION

STFAX operates in any ST resolution, color or monochrome. Insert your STFAX disk and double-click on the STFAX.TOS program icon. The program will show a small title box, and the flashing cursor indicates when it's ready to receive commands from the keyboard. Yes, STFAX is completely keyboard-driven, so you can retire your mouse for awhile.

Following are the active keys and their functions

Q —Quit the program.
L —Load a WEFAX picture from disk.
S —Save a WEFAX picture in DEGAS format to disk.
C —Clears the screen.
I —Inverses the image currently onscreen.
R —Resets the picture to the top and restarts the picture scan.
Z —Puts the scan to Sleep (Zzz).
> —Increases the number of timer "ticks" between interrupts. (Do *not* press the [SHIFT] key while typing this key.)
< —Decreases the number of timer "ticks" between interrupts. (Do *not* press the [SHIFT] key while typing this key.)
1 —Sets default values for 60 LPM pictures.
2 —Sets default values for 120 LPM pictures.
K —Rotates the LineSkip value from 0 through 3 and back.
- —Decreases the number of columns shown onscreen.
+ —Increases the number of columns shown onscreen. (Do *not* press the [SHIFT] key while typing this key.)
A —Adjusts the sync bar towards the left of the screen.
[SPACEBAR]—Switches between the text screen and the WEFAX screen.

TAKE A PICTURE

To receive and save a WEFAX picture, tune your shortwave radio to a WE-

continued on next page

FAX chirp. Plug the WEFAX Interface's radio lead into the earphone jack and its computer lead into the parallel port in back of the ST, with the power lead going to either joystick port.

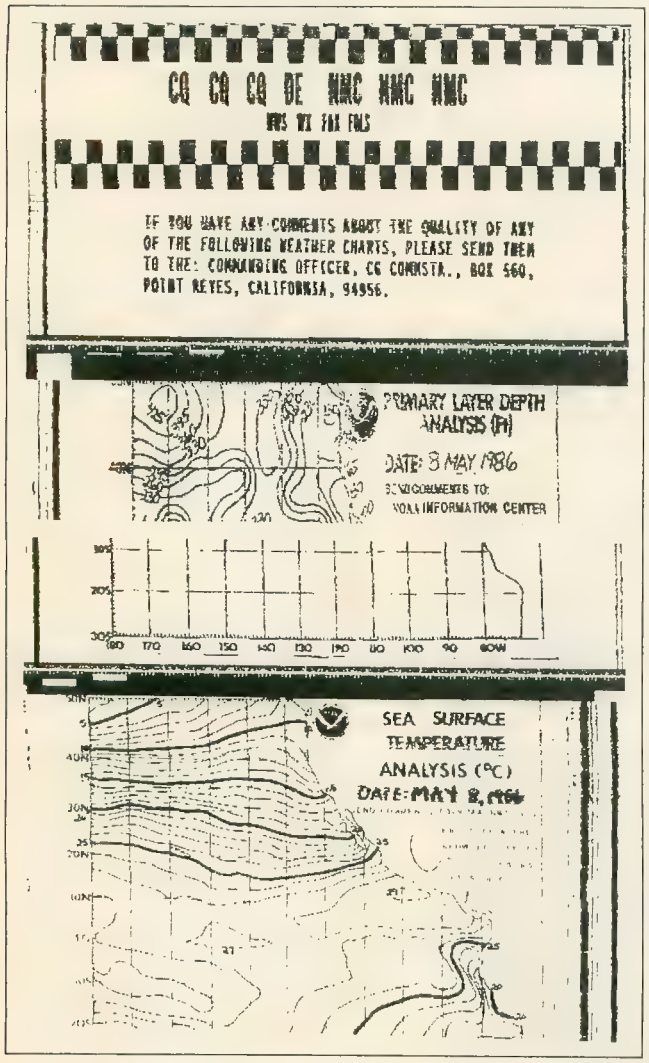
Do not fully insert the interface's plug into the earphone jack, or you may disengage your radio's speaker. For best results, you should slowly insert the plug only part-way into the earphone jack, so that your interface can receive a signal *without* disengaging the speaker. As an alternative, you may wish to connect a small speaker to the interface's audio input so you may listen to the signal as it is interpreted. This way, you can correct for frequency drift, or turn up the volume to compensate for a fading signal.

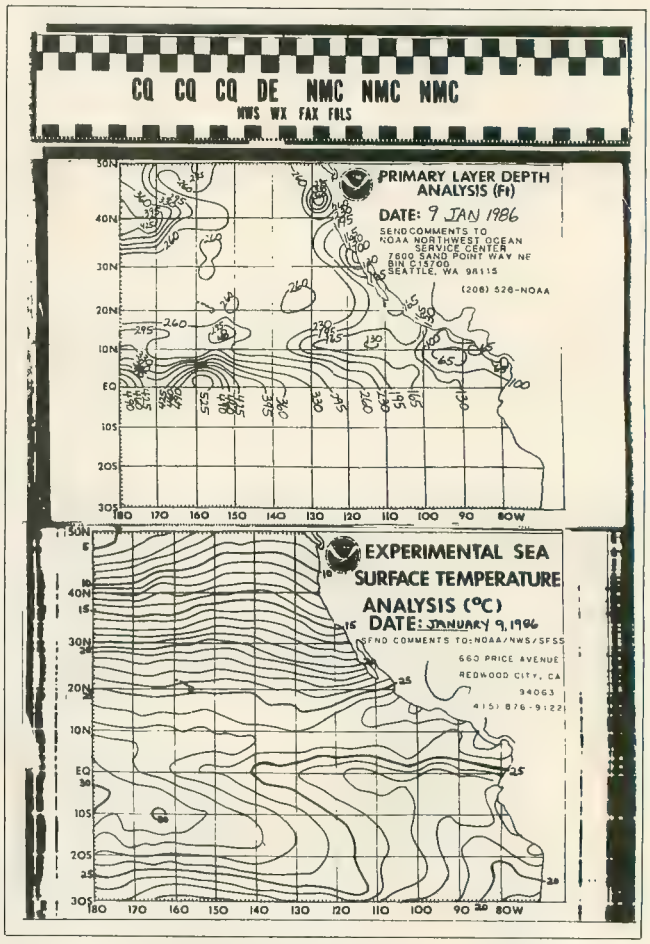
With the ST WEFAX Decoder program running, tap the [SPACEBAR] to switch to the WEFAX Screen. Now press the [R] key. The WEFAX picture will start appearing across the top scan line. You may wish to press the [K] key to increase the number of scan lines skipped between updates. This is needed because WEFAX Pictures are at least 800 scan lines high, and we can capture (at most) 400 lines of picture information. For example, a [K] line skip of 1 will capture every other line of the picture.

When the picture is finished, the scan will stop automatically. To save the picture in DEGAS format, press the [SPACEBAR] to switch back to the text screen. The WEFAX picture is still available by pressing the [SPACEBAR] again. While still at the text screen, press [S], then type in your desired filename for the picture. Remember, DEGAS wants different extenders for the different picture resolutions. Type in .PI1 for low resolution, .PI2 for medium resolution and .PI3 for high resolution.

PROGRAM TAKE-APART

It's not necessary to describe the program again here, because ST WEFAX Decoder's logic follows the 8-bit version *very* closely, even down to sharing labels and functions. There are liberal comments sprinkled throughout the important sections of code, so you should be able to follow the logic flow easily. See the 8-bit WEFAX Decoder article in this issue for detailed take-apart information.





On the left is a typical WEFAX chart sequence received with our 8-bit WEFAX program. On the right is a similar chart produced by the National Weather Service.

PIANO ROLLS PLAYED BY MY ATARI ST

ARE YOU KIDDING?!!!

NOW YOU CAN BRING SUPERSTARS OF THE KEYBOARD INTO YOUR HOME BY USING YOUR ATARI ST COMPUTER AND OUR MIDI MAGIC.

The appearance of the MIDI on home organs and synthesizers opens a whole new future for music. QRS player piano rolls from the 1900 to present day were performed by great artists from Scott Joplin, Fats Waller, and George Gerswin to Liberace, Peter Negro and other contemporary artists. This library of over 10,000 songs are being converted to digital signals and placed on floppy disks which are available for your ST computer.

THE ATARI ST PACKAGES ARE AVAILABLE FOR ONLY $32.95. IT INCLUDES A MIDI INTERFACE AND A SIX SONG SAMPLE DISK WITH CLASSICAL, CONTEMPORARY, SHOW MUSIC, and even RHAPSODY IN BLUE played by the composer GEORGE GERSWIN that you can enjoy with your MIDI equipped keyboard. We also sell CASIO, KORG, KEYBOARD AMPS, and MIDI PRODUCTS for other micro-computers. Call for prices.

THE MANAGER

The Manager ($149) is a feast of full-powered relational database software for the ST. It delivers excellent flexibility and scope in creating, searching and editing databases, as well as outstanding online help and error handling. The Manager can handle small, simple files or extremely complex applications such as a complete business accounting system. BMB Compuscience Software obviously understands what database users really need.

The Manager sorts files, links databases, or redesigns databases already containing information. It can also fix a damaged database and reconstruct indexes. It has a full set of utility programs for copying, deleting, listing and renaming the files and folders on your disks.

However, its [CONTROL], [ALTERNATE] and Function key commands make it complex to learn. Also, the program does not make use of GEM'S drop-down menus, windows, or the mouse. But it does let you use the ST's color potential. The Manager is an alternative—not a clone—to the widely used dBase II/III family of relational database programs.

With The Manager, you construct a database by laying out the screen format to fit the information you want to store. A screen can be designed in any four of the ST's colors. Each screen can be 23 lines long and is composed of individual categories of information called "fields." Fields can contain as many as 1,840 characters.

A set of screens is called a "record" and can have up to 32,000 fields. A database can handle a maximum of 32 different screens. However, the number of records making up a database is limited only by disk space.

MASSIVE PACKAGE

The Manager is massive, from the five program disks to the 400-plus pages of documentation. The larger of the two manuals is both a reference and a tutorial on using the set of programs. The other manual teaches the user to find, change, or add records and obtain reports using the included sample database. Strangely, the book contains nothing about creating your own database. That is left to the reference manual.

The hefty documentation is excellent in some places and poor in others. Some sections leave the reader hanging, describing many steps with specific examples and then being too general in the final step. For example, in the section explaining Manager Math, you're guided through rewriting a math file so that data is extracted from one database and sent to another. But once you have finished that modification, the instructions for actually using the new math program or writing data to the second file are too vague.

The documentation should be reorganized. It has detailed program instructions, but they're not all that clear. Sometimes you must flip back and forth between sections of the book—some of which you may not have read yet. A set of quick reference cards for each of the major options would help.

The five disks are not copy-protected. They contain the main system program and programs for database file creation, report setup, report generation and a sample database. While The Manager will run on a 520ST with one single-sided drive and a monochrome monitor, BMB recommends a hard disk, color monitor and printer. The

Massive database uses ST colors

Manager can use of all the ST's colors to design the database screens.

You receive a sixth disk, the Documentator, only after mailing in your warranty card—an effective ploy to get users to return their cards. This disk contains the programs that let you create help screens for providing your own hints to those who will use your database.

The dicusssion of directory, path names, etc. is clearly foreign to the GEM-based ST. The program even redefines the numeric keypad on the ST to act like the keypad on IBM-type computers, thus rendering it useless for numeric data entry.

The Manager uses both menus and commands, and you don't need to know programming until you use the advanced options. Online help is excellent. The help screens are keyed to both the option in use and to the command phase of that option.

FASTER THAN DBASE

I created a sample student database containing biographical information and high school and college grades. Selecting the option to create/revise took me to an editor that makes up screen versions of the forms containing the information to be stored. One screen was composed of the biographical information and the other had the grades.

The screen editor has over 50 commands for controlling the construction of a screen, most of which involve [CONTROL] or [ALTERNATE] key combinations. This is easier than it sounds. After defining your screens, you then define the kind of information to be stored in each field (text, integer, or decimal). You can then further define a field as Read Only, Display Only, Index, or Hidden. You can also redefine the order in which the cursor moves from field to field on data entry or editing.

It took me four or five times as long to construct this same student database in dBase II as in The Manager!

The Manager has an extensive report generation facility with several special features, including a separate main menu for report setup and generation. Reports can be as long as 250 pages in 80-column lines, or 151 pages in 132-character lines. However, it took me about two hours to discover something as simple as how to add the word "subtotal" to my subtotals and the words "grand total" to the grand totals for my report.

The Manager can read and write files as ASCII text files, as fill files (fixed format files used to modify a database or change the length of one or more fields), as DIF files and as dump files (for modifying a database without changing any field lengths).

You can also write files to be read by Multimate, a popular word processor for the PC. You can produce subfiles of your information—for example, all students with grade point averages above 3.5—which can be used to produce reports or build a new database.

BUILT-IN LANGUAGE

The package contains a solid structured programming language with a compiler and editor. Called Manager Math and Report Math, it is actually a database/file manipulation language somewhat similar to the one in dBase II. The differences, however, are enough to make programs written for dBase II files unusable by The Manager.

The language can be used in searches, in creation of subfiles and for reporting. It includes commands for opening and reading to files, for adding records and for altering data. It can also perform data entry checking and verification while the data is being entered or edited.

The only major features missing were trigonometric functions such as SIN or TAN, and statistical functions such as SUM or AVERAGE.

I didn't have many problems with The Manager, but I confused the program, and myself, when switching between different databases with the same name on different disks. The Manager worked fine on a single-drive system, although I had to swap disks twice as often. The routines to back up and recover files from the hard disks are not implemented in this version. I also couldn't use one of the Print Screen Revise/Edit options.

Some of the program's actions seem slow. For instance, it took 12 minutes to reload my 900-record database after I made changes in the screens. The editor for creating database screens certainly would benefit from the GEM interface, but it still is much easier to use and more powerful than ZIP, which is used in dBase II. And you can take advantage of the ST's character set and color spectrum.

The "PC feel" of the program has one benefit. Many people work with IBMs or clones at the office, and programs like The Manager or dBMAN (reviewed in **Antic**, August 1986) maintain continuity between home and office. Such software makes the Atari ST an attractive purchase for the professional who wants the power and style of the ST in a personal computer, but who must use other computers at work.

Overall, I like The Manager. It's extremely powerful. If you want a full-featured database program that makes use of all GEM has to offer, or if your database needs are simple, then The Manager is not the program for you. If you are comfortable with PC-style database programs and are willing to plow through the documentation and invest time to learn the commands, I believe The Manager would be a solid choice for your database software.

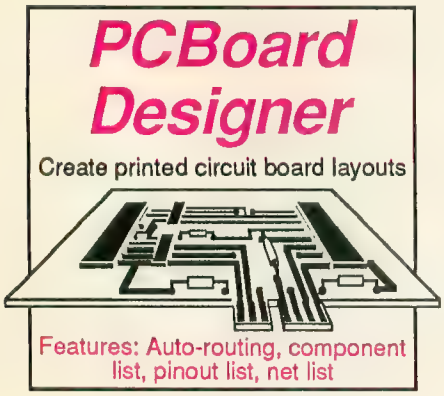
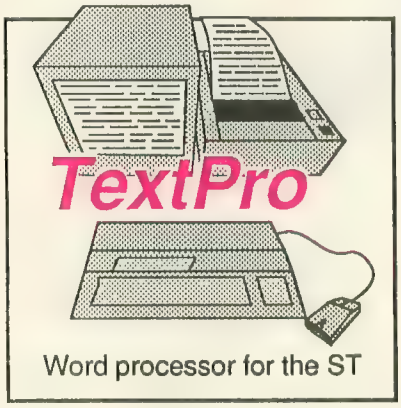
PROFESSIONAL PRODUCTIVITY

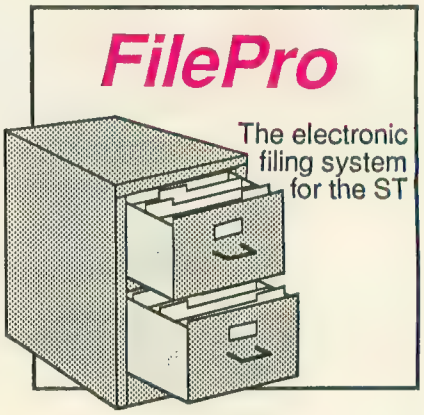
New ST software from a name you can count on...



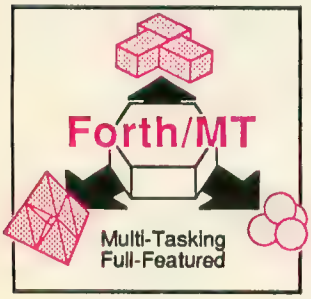
PCBoard Designer
Interactive, computer-aided design package that automates layout of printed circuit boards. **Auto-routing** with 45° or 90° traces; two-sided boards; pin-to-pin, pin-to-BUS or BUS-to-BUS. Rubberbanding of components during placement. Prints board layout, pinout, component list, net list. Output to Epson printer at 2:1. Pays for itself after first designed board. **$395.00**



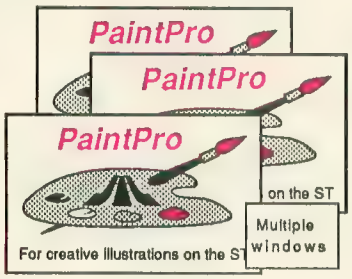
ST TextPro
Wordprocessor with professional features and easy-to-use! Full-screen editing with mouse or keyboard shortcuts. High speed input, scrolling and editing; sideways printing; multi-column output; flexible printer installation; automatic index and table of contents; up to 180 chars/line; 30 definable function keys; metafile output; much more. **$49.95**



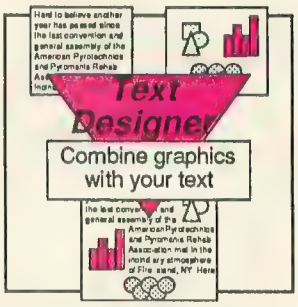
ST FilePro
A simple-to-use and versatile database manager. Features help screens; lightning-fast operation; tailorable display using multiple fonts; user-definable edit masks; capacity up to 64,000 records. Supports multiple files. RAM-disk support for 1040ST. Complete search, sort and file subsetting. Interfaces to TextPro. Easy printer control. **$49.95**



ST Forth/MT
Powerful, multi-tasking Forth for the ST. A complete, 32-bit implementation based on Forth-83 standard. Development aids: full screen editor, monitor, macro assembler. 1500+ word library. TOS/LINEA commands. Floating point and complex arithmetic. Available Sept. '86. **$49.95**



ST PaintPro
A GEM™ among ST drawing programs. Very friendly, but very powerful. A *must* for everyone's artistic or graphics needs. Use up to **three** windows. Free-form sketching; lines, circles, ellipses, boxes, text, fill, copy, move, zoom, spray, paint, erase, undo, help. **$49.95**



ST Text Designer
An ideal package for page layout on the ST. Accepts prepared text files from TextPro or other ASCII wordprocessors. Performs block operations— copy, move, columns. Merges bit-mapped graphics. Tools to add borders & separator lines, more. Available September '86. **$49.95**

ST AssemPro
Professional developer's package includes editor, two-pass interactive assembler with error locator, online help including instruction address mode and GEM parameter information, monitor-debugger, disassembler and 68020 simulator, more. Available Sept. '86. **$59.95**

FINANCIAL COOKBOOK

Electronic Arts
2755 Campus Drive
San Mateo, CA 94403
(415) 572-2787
$49.95

Reviewed by Sol Guber

Financial Cookbook is the first ST release from Electronic Arts. This personal finance program converted from EA's successful 8-bit product does many common calculations needed in everyday life. It does this simply and clearly, and is easy to use.

Financial Cookbook calculates future value of money, present value of annuities, internal rates of return and other functions needed for business decisions. There are 32 different "recipes" where you fill in the blanks and the program calculates the results, prints them on paper or saves them to disk.

With the first recipe, "Making Your Savings Last Forever," I tried to fulfill my dream of having enough money in the bank to never need to work again. The mouse is used to choose an option from a menu. Then a form appears with blank lines for filling in your amount of savings, the interest rate, the compounding period and your tax rate. I entered $5000 at 7 percent, clicked on COMPUTE, and a new window with the results appeared.

I learned that if I spent only $351

Max Seabaugh

per year, my money would never run out. I needed $502 at 10 percent per year and $2551 at 50 percent. Although this example is unrealistic (too bad), it gives you a good demonstration of what Financial Cookbook does. It answers "what if?" questions about common household financial situations. There are formulas for savings, investments, car financing. These formulas consider both inflation and your tax bracket.

Financial Cookbook comes with an excellent tutorial explaining in detail how to use the various formulas, and it even shows how the calculations are made. It's easy to enter the information and make corrections. It uses the GEM interface simply and unobtrusively, and it has both an index and a glossary.

This program is well thought out. I recommend Financial Cookbook as a home business calculator for its variety and ease of use.

CARDS

$39.95

Reviewed by Gregg Pearlman

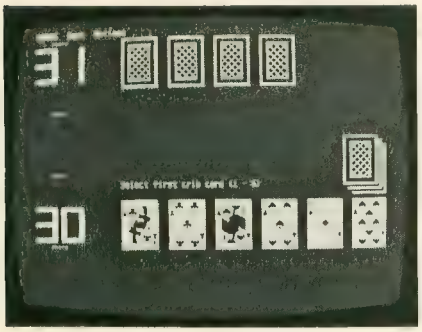
Programs that play blackjack have

continued on next page

been fairly common for some years. MichTron's **Cards** plays a superior game of blackjack, but it also throws in cribbage and three kinds of solitaire—klondike, poker squares and one called simply solitaire. Add slick graphics plus realistic gameplay and you've got a highly entertaining ST package.

The text on the Cards box describes the software as "fiendishly addictive" and this is not far wrong. Games go fast. The ST takes only a fraction of the time normally needed to deal a hand and it frees you from keeping score. You can use the keyboard if you wish, but it's usually much easier to select or move cards with the mouse.

Four blackjack players can try their luck against the dealer, and the odds



are definitely with the house. Just as in real-life blackjack, you can lose $500 in no time. And the ST can certainly count cards better than even the most seasoned player.

Klondike solitaire doesn't let you move cards as freely as you might like. It doesn't allow for much manipulation of the rows, but it still plays realistically and is frustratingly tough to win. Just when you think you had the worst hand in the world, the next one can be even worse. In a casino, this game could also cost you money. A deck of klondike cards costs $52, and you win back $5 for each card you build onto an ace, so you break even after 11 cards. It sounds much easier than it is.

Cribbage, a wonderful card game anyway, is excellent in this program. As always, the computer plays a mean game, but it's not impossible to beat. One plus is that the computer will catch all the points you might forget to add to your score in an actual cribbage game.

For the most part, Cards is an exciting, fun software package. The mouse simplifies and speeds play. And the ST won't try to collect the money you owe it. However, while the graphics are lively, watch out for that glaring purple background behind the cards in every game.

New Products

Antic Assistant Editor

We interrupt this game to announce—you have a lunch meeting! Royal Software's **Helpmate** ($39.95), yet another SideKick-style desk accessory for the ST, has a neat gimmick—an alarm appointment calendar. At the date and time of the appointment, any GEM-based application will be interrupted and an alarm will sound before a message announces the appointment.

STCalc ($49.95), a friendly GEM-based spreadsheet, features pull-down calculator and notepad desk accessories and the ability to "drag" the contents of one spreadsheet cell to a new location. **HelpCalc ST** ($24.95) is a set of 11 spreadsheet templates that can be used with ST Calc or Shanner International's VIP Professional. Includes templates for loan amortization, depreciation schedules, investment analysis, and checkbook register with automatic expense account allocation schedules.

Royal Software, 2160 West 11th Avenue, Eugene, OR 97402. (503) 683-5361. FINAL.

Sidecar, still another "SideClone" desktop organizer, includes calculator, calendar, notepad, address book, ASCII table to calculate the hex and decimal values of any recalled character and "Mini ST DOS"—a program that lets you perform DOS commands such as copy, delete and rename without returning to the ST desktop. Works in all ST graphic resolutions.

Migraph, 720 S. 333rd, Federal Way, WA 98003 (206) 838-4677. PRESS.

The **Volksmodem VM520** ($199) 1200/300 variable baud rate, direct-connect ST modem features auto-dial, auto-answer, built-in speaker and a five-year limited warranty. The fully Hayes-compatible modem includes the popular **ST Talk** telecommunications program.

Anchor Automation, 6913 Valjean Avenue, Van Nuys, CA 91406. (818) 997-7758. PRESS.

Softworks BASIC ($79) is a full-fledged BASIC language system with advanced data structures, superior string manipulation, and access to programs written in other languages.

2944 N. Broadway, Chicago, IL 60657. (312) 975-4030. FINAL.

ST 3-D Graphics ($24.95) may be the only book available that teaches three-dimensional computer-aided design in C language for the ST, describing such techniques as rotation and shading.

Reviewed by MIKE FLEISCHMAN

MEGAMAX C

"Don't even think about another C compiler"

Megamax C ($199.95), a new C compiler for the ST, is a full Kernighan & Ritchie implementation of the language. It supports floating point, overlays, recursion, batch processing and custom libraries. Aside from the Digital Research Inc. (DRI) Alcyon C, which comes in Atari's $300 ST Developer's Kit, Megamax is the only C that comes with a resource construction set that creates GEM objects such as menus, dialog boxes and icons. It also supports all the AES, VDI and GEM routines.

Megamax C has an environment shell that makes program development a joy. The shell supports and allows access to the editor, compiler, linker, librarian and any other program that can run in TOS. Initiation of programs is through drop-down menus.

The shell has a locate function which lets you tell the system where you have placed development programs such as the compiler and linker, as well as a MAKE file containing the compile and link commands for a specific program. The shell takes its commands from the MAKE file and runs automatically, permitting a compile and link with one click of the mouse.

To use this file, pull down the utilities menu and click on the MAKE line. If any changes have been made, the shell then compiles and links the program. Thus development in the shell is efficient: you click on the editor, modify your program, leave the editor and then click on the MAKE file. Errors would be placed in an error file, cancelling the MAKE process, and you are returned to the editor with two screens coming up automatically. The first screen displays the source code to the program you were compiling and the second shows the error file. This allows you to correct the errors while looking at the error file. The shell also lets you to rename or delete files and use whatever desk accessories you have running.

SIX TIMES FASTER

One of the first things you want to know about a programming language is its speed. I used a 3.5-inch disk system and a Sieve program to compare this compiler to Alcyon C. The Alcyon compiled and linked the Sieve program in six minutes, seven seconds. The resulting code was 11,852 bytes long, taking 2.47 seconds to run. The Megamax compiled the Sieve in one minute, 34 seconds—almost six times faster than DRI's Alcyon C. The code was 6,049 bytes long—just over half the length of the DRI compilation. And it took 2.28 seconds to run.

I also compared the compile and link time for the Apskel.C (applications skeleton) program that comes with both packages. The DRI compiler took four minutes, 16 seconds, producing object code 6,086 bytes long. The Megamax C compiler ran in 41 seconds and produced 4,808 bytes of object code. The DRI-supplied linker took two minutes, 17 seconds to link, producing a program of 4,915 bytes. The Megamax linker took 59 seconds and produced a program 4,058 bytes long. With Megamax C you can comfortably do development on a single disk. The DRI system requires two disks or a hard disk drive.

EDITOR EXCELS

The mouse-driven editor is easy to use, which I found hard to get used to at first—being a veteran of MicroEmacs and other keyboard-controlled editors.

continued on next page

The design of the editor shows that a great deal of thought went into it. The main commands are accessible from both the drop-down menus and the keyboard. You can open multiple file windows at once and move information between them. The windows can be in Overlap or Tile mode (where they don't overlap). You can cut and paste blocks, delete marked blocks or shift marked text right or left.

One real lifesaver is the Undo key buffer—if, for example, you've erased half of your program, just press the Undo key and it all comes back. This has saved my skin several times already.

The editor's configuration menu allows it to be customized to almost anyone's taste. You can set the tab size, toggle the auto-indent mode, choose the auto-save feature, make the tabs visible, or turn the case sensitivity on and off. The auto-save feature is handy if you live where electric power isn't too stable. The editor supports full search-and-replace features as well as a GOTO-line command. It also has a built-in table of the C operators and their precedence, which adds a nice touch. Finally, there is an information screen that gives you statistics on the program you are currently editing.

SINGLE PASS

A primary reason for the Megamax C compiler's speed is that it is a single-pass compiler. It only needs to read once through your source code to generate code for the linker. This is quite different than DRI's Alcyon C, which is a three-pass compiler. Single-pass compilers often have restrictions on how you must place your code (most often a function must be defined before it can be used). I am happy to report that Megamax has *somehow* gotten around this. After using that system for some time now, I have yet to run into anything that hints at those single-pass limitations.

The Megamax compiler also allows in-line assembly code, so you don't need to buy an assembler for time-critical routines. Unlike some other languages, the assembler isn't cut-down, nor does it require you to do most of the assembly by hand. Rather, it's full-featured. Just type ASM and a left curly bracket. From this point on, until a right curly bracket is encountered, write as though you were in an assembler, and the compiler will act as one.

Since the assembler is part of the compiler it has two major advantages. First, the code is efficient and well integrated into the program. Second, all the variables that would normally be accessed by a function are available to the assembly code, greatly simplifying the passing of data to the assembly routine.

LIBRARY LINKER

The linker is more complex than the DRI counterpart and it allows use of multiple libraries. Aside from the default system library, you can add your own custom libraries containing your functions and routines. The linker will load in only the library modules that the code needs. So your programs use only the routines necessary, instead of having the code for the whole library tacked onto it. The linker handles the process of overlays automatically. You don't need to specify anything in your code other than the word "overlay." The linker takes care of all the headaches.

The linker also gives you priority over the functions in the libraries. Any name that you define in your program is given precedence over the one in the library, so you can customize functions as the need arises. But the cost of all these benefits is speed. I found the Megamax linker to be only *twice* as fast as the DRI linker.

As if all of these features weren't enough, the Megamax package also includes a code improver (speed increase about 3 percent, size reduction about 10 percent), a disassembler and a librarian for setting up your own libraries.

The resource construction set is also a nice surprise. It seems easier to use than the Atari version. The documentation is complete and includes all the ST system calls. But don't expect to learn the language or the interrupt system from the manual, it was written to provide information on the implementation, not to teach.

Under Megamax's upgrade policy, you send in your master disk and a check for $20, and you'll receive the latest revision and all necessary documentation updates. Also, there are no royalties for selling programs produced with Megamax.

THE 32K DRAWBACK

There are a few drawbacks to Megamax C, though. It cannot compile into blocks larger than 32K, due to the limits of the computer that the progam was ported from. This means you must use overlays for large programs.

Arrays also cannot be larger than 32K, so moving an entire screen gets a bit tricky if you expect to do it in an array. But you can access plus or minus 2 billion bytes by using pointers, so this isn't very hard to overcome.

Megamax C is a good deal. If you plan to program in C on the Atari ST, don't even think about another C compiler. This one has it all. The ease of use and the speed of compilation would pay for Megamax C just in the time saved.

$199.95.

BOOK I + DISK: (The Original) Thoroughly explains the techniques used by advanced software pirates, and the copy protection methods used to stop them. It offers clear and understandable explanations sophisticated enough for software writers of any scale yet easy enough for a beginner just wanting to learn more about Atari® computers. A MUST READ FOR ALL ATARI® OWNERS.

BOOK INCLUDES: • Duplicate sectoring • Custom disk formatting • Creating "BAD" sectors • Hardware data keys • Legal protection like copyrights, trade secrets, patents • Protecting BASIC programs • Self-modifying Code • ROM + EPROMcartridges • Hidden serial numbers • Self-destructing programs • Freeware • Misassigned sectoring • Much, much more.

DISK INCLUDES: • Directory mover • VTOC scanner • Duplicate sector finder • Sector mover • Bad sector writer • Sector data displayer • Autorun builder • Other useful programs.

This comprehensive book and disk package should not be confused with low quality imitations offered elsewhere.

BOOK II + DISK II: Advanced Software Protection. This all new sequel starts where the highly acclaimed Book I leaves off. Book II is the most up-to-date resource available for the Atari® owner. Includes reviews and explanations of products such as: The Happy Enhancement,* The Impossible,* The Scanalyzer,* The Chip,* The Pill* and Super Pill* & many others.

Book II: Tells you specifically what they copy, what they won't, how they are used, and the details of how they work. Book II also includes such topics as: • Transmitting protected programs • Copying disks with more than 19 sectors/track. Includes the newest protection methods by companies like Synapse* AND Electronic Arts* • Data encryption • Phreaking methods • Program worms • Logic bombs • Bank-select cartridges • Random access codes • New trends in software law • Sample BASIC + Assembler programs • On-line security • And much more.

DISK II INCLUDES: • Automatic program protector • Custom format detector • Newest protection demos • Forced password appender • Data encrypter • And much more.

Book + Disk Packages only $24.95 each or Special Offer both for only $39.95

DIGITIZE YOURSELF

AT LAST A UTILITY THAT DOES IT ALL. Scans & Analyses ALL programs from Atari® programs. Works on programs stored on Disk, Cartridge or directly from memory • Converts complex machine language into readable assembler • Transforms ANY Atari® BASIC program into listable, modifyable BASIC • Changes a 4, 8 or 16K cartridge into a binary load file and source file that you can view & change using regular Atari® assembler. Clearly shows protection techniques such as: BAD SECTORS, BAD DATA MARKS, DUPLICATE SECTORS, and FORCED CRC ERRORS. NEW FEATURES: Now fully supports DOS 2.5 and includes fine pass sector copier for 130XE owners. Even finds and displays Hidden directories. No other program can do this!

NEW AND IMPROVED FEATURES!

THE Scanalyzer

$29.95

Complete with instructions in theory and use

IMPERSONATOR CARTRIDGE TO DISK COPY SYSTEM

CARTRIDGE TO DISK COPY SYSTEM Yes, for only $29.95, you can make working copies of all your Atari computer cartridges (16K or less). Our special package will let you save your cartridges to ordinary disk files. They will run exactly like the originals when used with the Impersonator. Each disk holds up to 12 cartridge programs. Now you can put all your real cartridges away for safe keeping and use the Impersonator for everything. YES, IT REALLY WORKS. The Impersonator does everything the high-priced cartridge back-up systems do...and more. **ONLY $29.95**

COMPUTER EYES, capture software and MAGNIPRINT II+ ..... Only $114.95

COMPUTER EYES/MAGNIPRINT Camera System
A complete ready to run system for those without access to video equipment. This system includes Computer Eyes, Magniprint II+, a high quality B/W video camera, and a 10 ft coaxial cable with appropriate connectors. Only **$299.95**

COMPUTER EYES alone (with capture and display software only) **$99.95**

Computer Eyes Gr.9 Acquisition Software..$12

Computer Eyes lets you take any form of video input and saves it as a high-resolution graphics screen. You can use a video camera, VCR, TV output, video disk, other computers, etc. Now you can capture your picture, your friends or any video image and show it on an Atari computer. Computer Eyes is an innovative slow scan device that connects between any standard video source and your Atari computer (see the review in A.N.A.L.O.G. magazine).

- Do a complete Hi-Res scan in under 6 seconds
- Unique multi-scan mode provides realistic grey scale images in 24 seconds, and up for more detail scans.
- Full one-year warranty on parts and labor
- Plugs into your Atari joystick ports and uses a standard video phono plug

Now anyone can create the kind of graphics seen in this ad. When Computer Eyes is combined with Magniprint II+, you get unique capabilities that no other system can offer

- Print pictures with full shading for a level of realism even better than your TV screen
- Take your Computer Eyes images and modify them with your Koala Pad, Atari Touch Tablet, Micro Illustrator program, or Magniprint's special touch-up feature

MAGNIPRINT II+

TAKE CONTROL OF YOUR PRINTER

Print your Graphics in an amazing variety of sizes, shapes and shades!

18 Proportionally correct sizes, including Huge Poster Printing
9 Levels of distortion to stretch or squeeze dimensions
14 Graphics modes – works with everything from Graphics 0 text to fully shaded Graphics 12
16 Levels of Shading for spectacular resolution and detail
24 Compatible Graphics Programs = Print your own pictures or those created with PRINTSHOP*, Koala Pad*, Micropainter*, RAMbrant*, B-Graph*, Syngraph*, PAINT*, MicroIllustrator*, ComputerEyes*, and many, many more.

+ZOOM Print the entire picture or zoom in on only the parts you want
+ALTER Automatically switch between graphics modes to add details and shades
+TOUCH UP Use your Joystick to change the picture, rotate colors, and select your own shades for printing
+HELP Instant Help Screen for easy use

TOTAL = MAGNIPRINT II+
Adds up to MORE POWER, MORE versatility, and MORE features than any other print program. And best of all it gives you BETTER QUALITY PRINT-OUTS.

By specially shading each printed pixel, MagniPrint II+ uses your printers full resolution for uncomparable quality and detail. MagniPrint II+ works with all EPSON, Gemini, STAR, NEC, Citoh, Panasonic, and any compatible printers (850 interface or equivalent required).

INCREDIBLE POWER AT AN AMAZING PRICE OF JUST $24.95

FREE. With every Magniprint II order get "PRINTALL" FREE. PRINTALL prints your programs and files just as they appear on the screen. It clearly prints INVERSE and all the Atari graphics characters, and prints in regular or condensed print. This alone is worth the price.

NOW for ST Owners

ATARI® ST GOES DIGITAL!!!

HIPPO VIDEO DIGITIZER

Use the full resolution and speed of your ST for incredible results. Capture a high or medium res picture in 1/60th of a second. Flip through 10 frames a second for Photo Quality animation. Use any standard video camera, VCR, video disk, or TV output. Save your pictures in NEOCHROME or DEGAS format for easy touch-ups and adding color.

Special Hardware and Software.....**only $119.95**

COMING SOON – POWERPRINT

Capture any ST screen and print it out with amazing versatility and styles. Select your own shading and print in hundreds of shapes and sizes. It makes the perfect companion for the video digitizer or your favorite graphics drawing program.

HIPPO SOUND DIGITIZER

Record and manipulate sounds in their pure digital form. Plug in the microphone (included) or hook it up to a radio, tape recorder, TV, etc. Comes with an audio output jack so you can play back through your stereo or PA system. Record, play, analyze, and manipulate pure digital sound using your ST's power and easy mouse control.

Comes complete with everything you need for only **$119.95**

gitize Your ice With Parrot
, so good it being used by fessional isicians a band.

PARROT

All new sound digitalizer and synthesizer for your Atari. Tired of low-quality mechanical sounding voice output? Now you can make any Atari speak in your own voice. Tired of four tone sound? Now any Atari can play a whole orchestra complete with a singing choir. "The Parrot" digital sound synthesizer system lets you do all this and much more.

How it works – "The Parrot" system plugs into your joystick port and lets you record pure digital sound from your stero, TV, microphone, or any other sound source. The special Parrot software lets you play back this high quality sound on any Atari system with no special hardware needed. It even lets you put this unbelievable sound right into your own programs, that will run on anyone's Atari. It also includes digital sequencer software that lets you turn your Atari into a synthesizer comparable to those costing thousands of dollars. Turn any natural sound into a musical instrument, or design your own custom sounds. Imagine playing a song with the sounds of a dog's bark, a chinese gong, a car's honk, your own voice, or anything your imagination can come up with. It turns your keyboard into an organ and lets you instantly switch between up to nine different digital sounds, each with three full octaves of notes. Recording time varies depending on available memory and quality level desired. You've got to hear it to believe it!!

THE PARROT digital input hardware and playback/synthesizer software with sample sounds and demos.

All for Only **$39.95**

All for your Atari Computers. Disk drive and 48K required. Atari® is a registered trademark of Atari Corporation. *Denotes products not related to Alpha Systems

PARADOX®
ENTERPRISES INC.

FOR ATARI™ 520 ST AND 1040 ST™ COMPUTERS

*THE MICROBYTE

Add the Microbyte to your ATARI™ 520 or 1040 ST™ and you will enjoy a 5¼ inch disk drive that can read and write to IBM™ diskettes. The Microbyte is available with either 40 tracks (IBM™ XT compatable) or 80 tracks (IBM™ AT compatable).

What is the Microbyte?

General Features:
5¼ inch floppy drive unit includes cable for direct connection to the ATARI™ computer or to the 3½ inch ATARI™ drive.

FCC CERTIFIED

Dimensions:
2.75" (69.85 mm) x 5.93" (150.8 mm) x 12.0" (304.8 mm),
Height x Width x Length.

Power Requirements: 110V AC

Characteristics:

Microbyte-A
Double Sided/Double Density
48 tracks per inch
360K capacity

Microbyte-B
Double Sided/Quad Density
96 tracks per inch
720K capacity

Coming Soon From PARADOX®
ENTERPRISES INC.

*IBM™ Simulator:
The new IBM™ Simulator from Paradox will enable your 520 or 1040 ST™ to run IBM™ programs.

*PATENT PENDING

SOFTWARE LIBRARY

Antic type-in listing section includes every full-length program from this issue. Listings are easier to type and proofread, easy to remove and save in a binder if you wish.

DISK SUBSCRIBERS: Programs for 8-bit Atari computers can be used immediately. Just follow instructions in the accompanying magazine articles. ST Owners: See monthly disk's ST Help File for instructions on how to transfer programs to 3-1/2 inch disk.

Antic program listings are typeset on the Star's SB-10 printer—from Star Micronics, Inc., 200 Park Avenue, New York, NY 10166.

TYPING SPECIAL ATARI CHARACTERS

Antic printed program listings leave a small space between each Atari Special Character for easier reading. Immediately below you will see the way **Antic** prints all the standard Atari letters and numbers, in upper and lower case, in normal and inverse video.

```
ABCDEFGHIJKLMNOPQRSTUVWXYZ
ABCDEFGHIJKLMNOPQRSTUVWXYZ
abcdefghijklmnopqrstuvwxyz
abcdefghijklmnopqrstuvwxyz
0123456789          0123456789
```

The Atari Special Characters and the keys you must type in order to get them are shown in the two boxes below.

NORMAL VIDEO

▯	⅄CTRL T	▗	ESC
▀	⅄CTRL U		CTRL INSERT
▮	⅄CTRL V		
▄	⅄CTRL W		
▙	⅄CTRL X		

Whenever the CONTROL key (CTRL on the 400/800) or SHIFT key is used, *hold it down* while you press the next key. Whenever the ESC key is pressed, *release* it before you type the next key.

Turn on inverse video by pressing the Reverse Video Mode Key ▚. Turn it off by pressing it a second time. (On the 400/800, use the Atari Logo Key ⅄ instead.)

Among the most common program typing mistakes are switching certain capital letters with their lower-case counterparts—you need to look especially carefully at P, X, O and 0 (zero).

Some of Atari Special Characters are not easy to tell apart from standard alpha-numeric characters. Usually the Special Characters will be boxed. Compare the two sets of characters below:

SPECIAL		STANDARD	
▚	CTRL F	/	/
▞	CTRL G	\	SHIFT +
▁	CTRL N	_	SHIFT -
▬	CTRL R	-	−
▚	CTRL S	+	+

HOW TO USE TYPO II

TYPO II is the improved automatic proofreading program for **Antic's** type-in BASIC listings. It finds the exact line where you made a program typing mistake.

Type in TYPO II and SAVE a copy to disk or cassette. Now type GOTO 32000. When you see the instruction on the screen, type in a single program line **without the two-letter TYPO II code** at left of the line number. Press [RETURN].

Your line will reappear at the bottom of the screen with a two-letter TYPO II code on the left. If this code is not exactly the same as the line code printed in the magazine, you mistyped something in that line.

To call back any line previously typed, type an asterisk [*] followed (without in-between spaces) by the line number, then press [RETURN]. When the complete line appears at the top of the screen, press [RETURN] again. This is also the way you use TYPO II to proofread itself.

To LIST your program, press [BREAK] and type LIST. To return to TYPO II, type GOTO 32000.

To remove TYPO II from your program, type LIST "D:FILENAME",0,31999 [RETURN] (Cassette owners LIST "C:). Type NEW, then ENTER "D:FILENAME" [RETURN] (Cassette—ENTER "C:). Your program is now in memory without TYPO II and you can SAVE or LIST it to disk or cassette.

Owners of the BASIC XL cartridge from O.S.S. type SET 5,0 and SET 12,0 before using TYPO II.

TECH TIPS

CASSETTE SOUNDTRACK

Don't retire that faithful old cassette recorder into the closet after you upgrade to a disk drive. Use it to play a music soundtrack or voice narration controlled by your BASIC programs. The sound will come out of your TV or monitor speaker.

Insert a cassette recording into the drive and press the Play button. Whenever you want the soundtrack to start, cue it with a program line such as:

```
10 POKE 54018,60:REM TURN ON CASSETTE MOTOR
```

When you want to turn off the sound, use this line:

```
20 POKE 54018,52:REM TURN OFF MOTOR
```

SLOW-MOTION LISTING SCROLLER

Wouldn't it sometimes be useful to examine your BASIC program as the listing slowly scrolls by— either forward or backward? That's what you'll get if you insert these eight simple lines of code at the beginning of whatever other BASIC program you are working on.Type in the listing below and LIST it to disk. (This program utilizes line numbers 0 to 7, so make sure to start your main program at a higher line number.) ENTER the eight-line program from disk after your main program is in memory, and it will be installed at the beginning. Do not use SAVE and LOAD for this program, because that would erase your new program from memory.

Type RUN and you will be prompted for a starting and ending line number. After answering, you may scroll forward or backward one line at a time by pressing either the [SELECT] or [OPTION] keys. **Antic** found this program by Jerry Ilaria in the newsletter of the Jersey Atari Computer Society.

```
0 POKE 710,2:? "START LINE #";:INPUT L:? "END LINE #";:INPUT E:? CHR$(125):?:?:?
1 ? "PRESS [SELECT] TO SCROLL FORWARD":? "PRESS [OPTION] TO SCROLL REVERSE";:?:?:?
2 LIST L:IF L=0 THEN L=1:LIST L
3 IF L=E THEN END
4 P=PEEK(53279):IF P=7 THEN 3
5 IF P=3 THEN L=L-1:GOTO 2
6 IF P=5 THEN L=L+1:GOTO 2
7 IF P<>3 OR P<>7 THEN 3
```

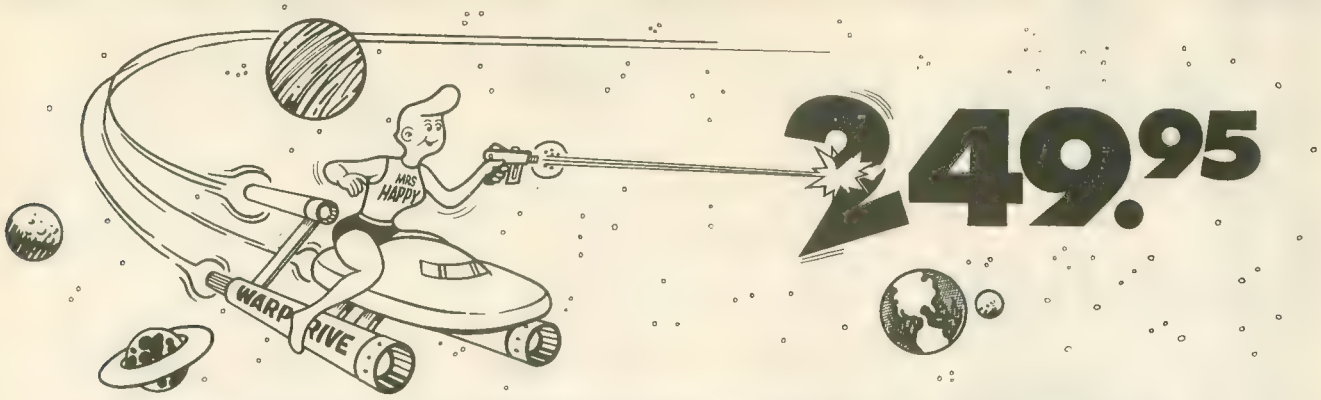
ATARI DISK DRIVE OWNERS . . .

HAPPY BLASTS RETAIL PRICE—ORDER TOLL FREE!



THE FAMOUS HAPPY ENHANCEMENT NOW ONLY $149.95
for 1050 order number HC1A, for 810 order number HC8A

Makes your disk drive read and write faster, and allows you to execute the HAPPY WARP SPEED SOFTWARE. Available only for ATARI 1050 and 810 disk drives. 1050 version allows true double density plus the original single and enhanced density. PRICE INCLUDES WARP SPEED SOFTWARE BELOW, installation required.

HAPPY WARP SPEED SOFTWARE REV 7 (not sold separately)

Includes the famous HAPPY BACKUP and COMPACTOR which are the most powerful disk backup utilities available for your ATARI computer, plus MULTI DRIVE which allows high speed simultaneous reading and writing with up to 4 HAPPY ENHANCED drives, plus SECTOR COPIER which is the fastest disk copier that supports the 130XE RAMDISK, plus the WARP SPEED DOS which improves ATARI DOS 2.0s to allow fastest speed, plus HAPPY'S DIAGNOSTIC which allows comprehensive disk drive testing.

HAPPY 1050 CONTROLLER $64.95 order number HC2A

For use with HAPPY ENHANCED 1050 disk drives only. Allows easy access to HAPPY 1050 slow and fast speeds and ultimate control of disk drive write protect, including writing to disk back side and protecting valuable data disks. Printed circuit board has switches and write protect indicator LED, installation required.

GET YOUR FAVORITE HIGH SPEED DOUBLE DENSITY DOS

Both of these disk operating systems support the fastest speed with both HAPPY 810* and 1050, and with HAPPY 1050 you get true double density. WARP SPEED DOS XL is HAPPY's own version of OSS DOS XL, and includes. under cartridge, under ROM and AXLON RAM disk version, and is order number HC4A at $29.95. TOP DOS version 1.5 from ECLIPSE SOFTWARE has more menu driven features, operates in all three densities, supports the 130XE RAMDISK, and is order number HC6A at $39.95. *Note: 810 requires upgrade below.

810 VERSION 7 UPGRADE $49.95 order number HU3A -XXXX

Allows older 810 HAPPIES to use newer software. Includes custom plug in IC and rev 7 WARP SPEED SOFTWARE. Same price for all HAPPY 810s registered or not. When ordering replace XXXX in part number with the serial number of your HAPPY COMPUTERS manufactured 810 board, or with a 2732 or 2532 which corresponds to the EPROM part number in your HAPPY 810 socket A102 of your side board modified HAPPY (not made by HAPPY COMPUTERS), installation required. Upgrade not needed for new 810 HAPPYS and serial number over 8000.

SUPER PACKAGE SPECIALS

Get a HAPPY 1050 ENHANCEMENT and CONTROLLER and WARP SPEED DOS XL for just $199.95 order number HS5A, or get the same with TOP DOS 1.5 instead of DOS XL for just $214.95 order number HS7A. If you already have the 1050 ENHANCEMENT you can get the HAPPY 1050 CONTROLLER and WARP SPEED DOS XL for $74.95 order number HXL9A, or get the HAPPY 1050 CONTROLLER and TOP DOS 1.5 for just $84.95 order number HTD9A. For other specials and dealer pricing call (408) 779-3830.

All prices include UPS shipping in USA, add $10.00 for shipment outside USA. California residents add sales tax. No extra charge for credit cards or COD, VISA or MASTERCARD accepted. Our toll free number is an order taking service, not our line. To ORDER ONLY call (800) 538-8157 outside California, or (800) 672-3470 inside California, ask for extension 817 and have your credit card, part number and quantities ready. Toll free hours 6 am to 12 pm Mon.–Fri., 8 am to 8 pm Sat. & Sun., Pacific Time. For answers to questions call HAPPY COMPUTERS at our number below. Office hours 9–5 Mon.–Fri. Pacific Time.

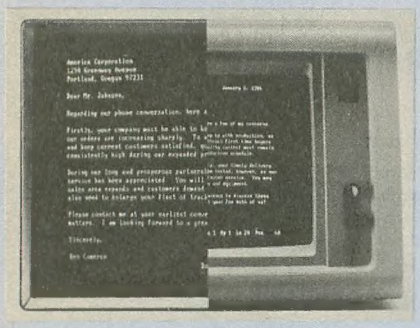
New Products notices are compiled by the **Antic** staff from information provided by the products' manufacturers. Antic welcomes such submissions, but assumes no responsibility for the accuracy of these notices or the performance of the products listed.

SUPER REEVEKEY

(utility software)
Reeve Software
29W150 Old Farm Lane
Warrenville, IL 60555
(312) 393-2317
$19.95, XL/XE, 48K disk
The **Super ReeveKey** handler for the Atari CX85 10-key numeric pad allows you to load customized keypad layouts. It works with widely used spreadsheets and databases such as SynCalc, SynFile+, HomePak and Homecard.



CRT MAGNIFIER

(glare screen)
20/20 Concepts Ltd.
4000 Westerly Place, Suite 100
Newport Beach, CA 92660
(714) 955-2232
$195.50
This combination video screen provides 2X magnification and an antiglare filter for monitors, enhancing contrast. A Metal-Oxyde coating on the filter absorbs harmful radiation.

RITE NOTCH

(peripheral board)
Micro-Tronix
P.O. Box 19296
Cleveland, OH 44119-0296
(216) 531-8549
$24.95 (installed $29.95)
Rite Notch installs in your Atari 1050 disk drive. Flipping a switch lets you write to your disk without a notch, or automatically write-protects it. No soldering or cutting is required, but you need to drill three holes in the drive's casing.

CHECKBOOK PLUS

(productivity software)
A-Plus Enterprises
3790 Blenheim Road
St. Joseph, MI 49085
(616)429-8666
$14.95, 48K disk
With **Checkbook Plus**, your 8-bit Atari can balance your checkbook, save the data and print it out, as well as helping budget your account.

STYLEWRITER

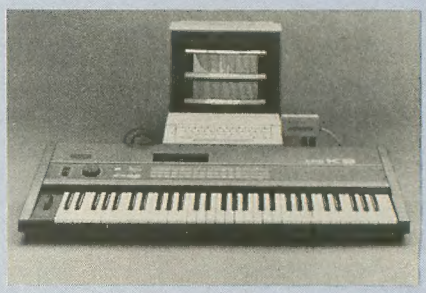
(printer peripheral)
Carolina Engineering Laboratories
818 Tyvola Road, #109
Charlotte, NC 28210
(704) 525-4423
$198—8K buffer
$228—64K buffer
$258—128K buffer

StyleWriter is a type font loader that operates as a "transparent" Centronics parallel interface unit for graphics-capable dot matrix printers. It uses an 8085 microprocessor to speedily translate ASCII text into a variety of letter-quality type styles. Three type fonts are built-in and optional plug-in fonts are also available. The 128K buffer holds about 65 pages.

ACTION ANNEX BBS SYSTEM

(bulletin board software)
Unique Publishing Co.
8002 N.E. Highway 99, No. 260
Vancouver, WA 98665
(206) 573-8628
$49, 48K disk

Speed, flexibility, complete program documentation, author-maintained support, Hayes and Atari modem compatibility, easy upload/download files—these are the qualities that the publisher of **Action Annex BBS System** says make the program unique in the BBS field. The system is designed to be easily customized by the sysop and oriented to the special capabilities of the Atari.



MIDI EDITOR

(music software)
Kawai America Corp.
24200 S. Vermont Avenue
Harbor City, CA 90710
(213) 534-2350
Price unavailable, 130XE
This software interfaces the Atari 130XE with the Hybrid Arts MIDItrack III 16-track MIDI sequencer and the Kawai K3 synthesizer. It is a wave table editor, tone patch editor and tone patch librarian rolled into one.

221 B BAKER STREET

(entertainment software)
IntelliCreations Inc.
19808 Nordhoff Place
Chatsworth, CA 91311
(818) 886-5922
$29.95, 48K disk
221 B Baker Street, a graphics/text game featuring Sherlock Holmes and Dr. Watson, sends as many as four players through the foggy alleys of Victorian London gathering clues and trying to break secret codes that will solve the Case of the Blackmailed Poker Players.

Return the favor. When you call a manufacturer or supplier about a product you've seen advertised or otherwise mentioned in ANTIC, please tell them so. This will help us to continue to bring you the latest information about products that will make your Atari computer an even more valuable investment in the future.

Tokyo for $19.95

東京

In the continuing evolution of scenery, SubLOGIC introduces the Japan and San Francisco Bay Area Scenery Disks for Flight Simulator II.

- Tokyo to Osaka is a comfortable 240-mile flight. The natural beauty of the Japanese coastline and mountain ranges complement the standard cross-country details.

- The beautiful San Francisco Bay Area "Star" Scenery Disk is perfect for concentrated sight-seeing.

- For the cross-country adventurer, our standard Western U.S. scenery (Disks 1-6) contains major airports, nav-aids, cities, highways, rivers, lakes, and mountains.

SubLOGIC Scenery Disks are available individually for $19.95. The six-disk Western U.S. set is available for $99.95. See your dealer, or write or call SubLOGIC for more information.
